Reported Road Casualties Scotland 2015

A National Statistics Publication
for Scotland

REPORTED ROAD CASUALTIES SCOTLAND

2015

A National Statistics publication for Scotland

Brief extracts from this publication may be reproduced provided *Reported Road Casualties Scotland* is fully acknowledged as the source. Proposals for larger extracts should be addressed to the enquiries address below.

Conventions

Symbols used: the following are used throughout:

- .. not available
- or 0 nil or less than half the final digit shown
- n/a not applicable

Rounding: in some tables, where figures have been rounded independently, the sum of constituent items may not appear to agree exactly with the total shown.

Enquiries

Enquiries of a routine nature, or on the availability of the next edition of the publication, can be made to the Transport Statistics branch, by contacting:

Mr Andrew Knight or Mr Charlie Lewis
Transport Statistics branch
Transport Scotland
Victoria Quay
EDINBURGH
EH6 6QQ
Telephone: 0131-244 7256 or 7255
Fax: 0131-244 7281
E-mail: transtat@transport.gov.scot

Major enquiries or suggestions for improvement to the publication should be addressed to the transport statistician – Richard Morrison - at the address above.

Readers may request further analyses of the road accident statistics held in the Scottish Government Transport Statistics branch database, but three points should be noted:

1. The Transport Statistics branch does *not* answer requests for local information: these should be addressed to Police Scotland or the appropriate Council.
2. The amount of information that can be provided in response to requests may be limited, depending upon the resources that are available to carry out the work, and on any restrictions that may be necessary to maintain the confidentiality of the data.
3. A charge may be made, depending upon the amount of staff time required to answer a request.

Web and Excel versions of the publication

Go to: <http://www.transportscotland.gov.uk/analysis/statistics/publications/reported-road-casualties-scotland-previous-editions>

Some extra road accident statistics tables are available via:

<http://www.transportscotland.gov.uk/analysis/statistics/datasets/RoadAccidentTables>

A separate page, just before the end of this publication, provides more information about what is available from the Transport Statistics Web site.

Table 28	Reported adult casualties by time of day and mode of transport, separately for weekdays/weekend, 2011-2015 average	124
Table 29	Reported child and adult casualties by month and mode of transport, 2011-2015 average	126
Table 30	Reported child and adult casualties by day of week and mode of transport, 2011-2015 average	127
Table 31	Population estimates, number of reported casualties and casualty rates per thousand population	128
Table 32	Reported casualties by age and severity, separately for each mode of transport, numbers and rates per thousand population, 2011-2015 average	130
Table 33	Reported casualties by speed limit, mode of transport and severity, 2011-2015 average	135
Table 34	Reported casualties by age, severity and sex, separately for each casualty class, numbers and rates per thousand population, 2011-2015 average	136
Table 35	Reported child and adult pedestrian casualties in single vehicle accidents, by pedestrian action, and pedestrian crossing details, 2004-08 and 2011-2015 averages, 2011 to 2015	138
Table 36	Reported casualties by council, severity and road type, 2004-08 and 2011-2015 averages, 2011 to 2015	140
Table 37	Reported casualties by police force area, council and severity, 2004-08 and 2011-2015 averages, 2015	151
Table 38	Reported pedestrian casualties by police force area, council and severity, 2004-08 and 2011-2015 averages, 2015	153
Table 39a	Estimated distance between the home of the reported casualty and the location of the accident by road user type and police force area in which the accident occurred, 2015	155
Table 39b	Casualties involved in reported accidents: Council of residence vs council of accident location 2015	157
Table 40	Killed & seriously injured casualties: child casualties and all ages, by council and road type: 2004-08 and 2011-2015 averages, 2005 to 2015	159
Table 41	Slight casualties, estimated total volume of traffic, and slight casualty rate, by council and road type: 2004-08 and 2011-2015 averages, 2006 to 2015	176
Table 42	Casualties killed or seriously injured, child killed or seriously injured, slight casualties, estimated total volume of traffic, and killed/serious casualty rate by police force area: 2004-08 and 2011-2015 averages, 2006 to 2015	187
Table 43	Reported casualties by severity and quarter, 1981 to 2015	192

Preface

This publication presents detailed statistics about the circumstances of personal **injury road accidents** in Scotland that were **reported by the police** using the Stats 19 statistical returns (described in more detail in *Appendix B*). Each accident is classified according to the severity of the injury to the most seriously injured person involved in the accident. These statistics are used to inform public debate and support policy on road safety (through education and engineering programs).

This publication also includes statistics related to further analysis on specific road safety topics. For example:

- **Valuation of road accident and casualties:** Table 9 presents estimates of the value of preventing reported road accidents in GB and Scotland, based on DfT analysis.
- **Drink drive estimates:** Table 22 presents estimates of the levels of accidents and casualties involving drivers and riders with illegal alcohol levels using Procurator Fiscal data.

In addition to the statistical tables and commentary the publication contains 2 articles discussing further analysis of the statistics:

- Article 1 examines progress towards **casualty reduction targets**;
- Article 2 describes **contributory factors** attributed to reported road accidents and casualties.

A series of factsheets providing information about pedestrians, pedal cyclists, motorcyclists, cars, light goods and heavy goods vehicles can also be found on our Website here:

<http://www.transportscotland.gov.uk/statistics/reported-road-casualties-scotland-all-editions>

Review of Stats 19

National & local government police forces across Great Britain work closely to achieve an agreed standard for the system for collecting & processing statistics on road accidents involving personal injury. The statistics are subject to regular reviews as part of the continued drive to improve quality and meet user needs whilst minimising the burden of collection. The results of the recent review, including results of the public consultation were published by the DfT on 5 August 2010. The review made a number of recommendations for change to the process, coverage and definition of the Stats 19 collection system which have been implemented for the collection of data from 2013. Details can be found at:

<http://webarchive.nationalarchives.gov.uk/20110503151558/http://dft.gov.uk/pgr/statistics/committeesusergroups/scras/2008reviewstats19/>

UK Statistics Authority assessment

These statistics were assessed during the summer of 2010 by the UKSA against the Code of Practice for Official Statistics. Their final report is published on their website at

<http://www.statisticsauthority.gov.uk/assessment/assessment-reports/assessment-report-61---statistics-on-transport-in-scotland.pdf>

Further details on the role of the UKSA and the assessment process can be found at:

<https://www.statisticsauthority.gov.uk/publication/statistics-on-transport-in-scotland/>

The status of the statistics

Most of the data used in this publication were extracted from the Road Accidents statistical database on the **2 September 2016**. The statistics given here may differ slightly from those published elsewhere (e.g. provisional figures published in *Key Road Casualty Statistics* in June) because they were extracted on a different date and wouldn't incorporate any later changes (e.g. due to late returns or late corrections). Any late returns will be incorporated into the next available publication.

The information held in Transport Scotland's Road Accident Statistics database was collected by the police following each accident, and subsequently reported to Transport Scotland. Transport Scotland's statistics may differ slightly from the local authorities as changes or corrections that local authorities may have made, for use at local level, to their own data may not always be accounted for in the Transport Scotland database.

The years covered in the tables

Some tables present a time series so that any trends can be identified. However, more detailed tables provide figures in the form of 5-year annual averages (e.g. 2011-2015), and do not present figures for the

latest single year. This smoothes out levels of variation often present with low numbers of accidents and casualties. If readers require versions of the detailed tables for single years, these can be provided on request.

Road casualty reduction targets

In many of the tables, the latest figures are compared with the annual averages for 2004-08. This is to allow comparison against the 2020 Scottish specific casualty reduction targets published within the Scottish Road Safety Framework in 2009.

Article 1 discusses these targets in more detail, monitoring progress and exploring differences between modes of travel.

Estimates of the total volume of road traffic

Some tables include estimates of traffic volumes, or accident or casualty rates calculated from them. The traffic estimates were provided by the Department for Transport (DfT), which produces estimates of the total volume of road traffic for Scotland and for other parts of Great Britain. Care should be taken when using these estimates and a detailed description can be found in Appendix D of this publication.

Other Scottish Transport Statistics

Reported Road Casualties Scotland is one of a series of Transport Statistics publications. Details of other Transport Scotland statistics can be found at <http://www.transportscotland.gov.uk/analysis/statistics>.

SUMMARY

Reported Road Casualties 2015 – Key Points and Trends

SUMMARY

Key figures – **casualties** in 2015

168 killed ↓ -42%
1,596 seriously injured ↓ -39%
9,204 slightly injured ↓ -35%
10,968 total casualties ↓ -36%

Since 1995 in Scotland, **road traffic** has continued to rise, while **accidents** have fallen.

Scotland is on track to meet both the **2015 milestone** and **2020 targets** for reductions in casualties killed based on a 2004-2008 average baseline

Number of casualties in 2015 Change since 2014

Child casualties of all severities have **more than halved** in the past decade

2,395 → **972**
2004 2015

Context – historical trends show **large decreases** in car and pedestrian fatalities over the past twenty years

"other" modes not shown

Road accident fatalities in 2015 by local authority

Table A: Summary of reported road injury accident and reported casualty statistics: 2005 to 2015

	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015

1. Built-up roads have a speed limit of up to 40mph; Non built-up roads have a speed limit of over 40mph

2. Estimates, adjusted for under-reporting as described in the text accompanying Table 22. The latest year's estimates are not yet available.

3. Estimated total costs (including damage only accidents) at 2014 prices, calculated as described in the text accompanying Tables 9 to 11.

4. Child 0-15 years

Table B: Summary of reported injury accidents by council and severity

Note: A road accident may contain one or more casualties who are injured, each accident is recorded once in the tables below, irrespective of the number of casualties. Accident severity is based on the severity of the most severely injured casualty from that accident. For more information see appendix D.

Commentary

1. Trends in the reported numbers of Injury Road Accidents and Casualties

1.1 Main Points

Table 1 shows the long-term trends in the reported numbers of injury road accidents and casualties, the population of Scotland, the number of vehicles licensed, the length of the road network and the volume of traffic. Information on the severities of the accidents, and of the injuries suffered by the casualties, is provided in Table 2. The numbers of injury road accidents were first recorded separately in 1966, while the numbers of casualties are available back to 1938 with annual collection of data starting in 1950. Figures 1 to 7 illustrate the trends in the reported numbers of injury road accidents and casualties including (in some cases) indications of the likely range of random year-to-year variations (see section 1.4). As mentioned in the introduction, injury accidents not reported by the public to the police won't appear in the returns. Note that each accident will result in one or more casualties. For example a fatal accident could result in two fatalities and a serious injury which would count as one accident and 3 casualties.

Accidents

- In 2015, there were 157 **fatal accidents**, 24 (13%) less than in 2014.
- **Serious injury accidents** between 2014 and 2015 decreased by 74 (5%) to 1,417.
- **Slight injury accidents** fell by 270 (4%) between 2014 and 2015 to 6,900.

Casualties

- There were 168 people **killed** in road accidents in Scotland in 2015, 35 (17%) less than in 2014.
- 1,596 people were **seriously injured** in road accidents in 2015, 108 (6%) less than in 2014.
- 9,204 people were **slightly injured** in road accidents in 2015, 196 (2%) fewer than in 2014.
- There were a **total number of 10,968 casualties** in 2015 – 339 (3%) fewer than in 2014.

The figures for all types of injury were the lowest since records began.

The reductions in the numbers of accidents and casualties in recent years are notable particularly given the rise in vehicle and subsequent traffic e.g. in 2015 the number of vehicles licensed in Scotland was about an eighth higher than in 2005 and traffic on Scottish roads was estimated to have grown by six per cent since 2005.

1.2 Reported Accidents

In 1966 there were just over 23,200 injury road accidents and the annual total remained around this level until 1973. Numbers then dropped considerably in 1974 and 1975 to about 20,600. This was the time of a fuel crisis when a national speed limit of 50 mph was introduced and the volume of traffic in Great Britain fell by 3% in

1974. Accident numbers increased again in 1976 and reached a peak of nearly 23,100 in 1979.

In the early 1980s numbers began to fall, and did so particularly sharply in 1983 when the total number of injury accidents fell by 7% in a single year to 19,400, serious accidents fell by 13% to just over 6,400, and fatal accidents fell by 11% to 568. The 1981 Transport Act came into force in 1983 and changed the law relating to drink driving, with the introduction of evidential breath testing. Compulsory front seat belt wearing and new procedures for licensing learner motorcyclists were also introduced in 1983. After 1983 the total number of injury accidents increased again to over 20,600 in 1985, and the number of serious accidents rose to just over 6,500 while fatal accidents continued a downward trend.

By 1987 the total number of injury accidents had fallen to under 18,700, but in 1989 it rose to just over 20,600. 1989 was the most recent peak in the total number of injury accidents. Since 1989, the total number of injury accidents has fallen in 24 out of 26 years, and in 2015 it was at the lowest level ever recorded. The 2015 figure of 8,474 was 368 less than in 2014.

Since the late 1980s, the number of **fatal accidents** has fallen considerably e.g. from 517 in 1987 to 157 in 2015. For **serious accidents**, the trend has also been downwards. The number of serious accidents has fallen e.g. from 5,814 in 1989 to 1,417 in 2015. The numbers of **slight accidents** have not changed as much over the years: oscillating between 12,000 and 15,000 from 1970 to 1998. The most recent peak level was 14,443 in 1990. However, they fell below 12,000 in 1999, and the 2015 figure of 6,900 was the lowest since slight accident numbers were first recorded in 1970.

1.3 Reported Casualties

As the numbers of accidents have fallen, so have the numbers of casualties. Therefore, this section does not repeat the previous section's detailed analysis of how the numbers have changed. Details can be found in Table 2.

Numbers killed

In 2015 there were 168 people killed in road accidents in Scotland, a decrease of 17% on 2014. With a few exceptions, figures fell in each year since 1978, showing a clear, steady long-term downward trend, particularly between 1982 and 1994. Since then, figures have been fluctuating around a less pronounced downwards trend. The number in 2015 was 7% below the average for the previous five years (181).

Numbers seriously injured

In 2015 there were 1,596 people seriously injured in road accidents: 108 (6%) less than in 2014. The long term trend shows that the number of serious casualties peaked in the early 1970s at around 10,000 and generally fell since the early 1980s. However, there has been some fluctuation around the long-term downwards trend, and appeared to level-off: 1996, 1997 and 1998 were around 4,050. But the downward trend subsequently resumed.

Numbers slightly injured

In 2015 there were 9,204 people slightly injured, 196 (2%) fewer than in 2014, and the lowest number since records began. Between 1970 and 1990, the figures fluctuated between 17,000 and 21,000. The fall between 1990 and 1995 was followed

by an apparent levelling-off at around 17-18,000 in each of the years from 1996 to 1999. However, 2000 to 2015 showed consecutive falls suggesting a continuing downward trend.

Total numbers of casualties

In 2015 there was a total of 10,968 casualties, 339 (3%) fewer than in 2014 (The lowest number recorded). Between about 1970 and 1990, the figures fluctuated around a general downward trend. Subsequently, the casualty figures fell markedly from the level of the most recent short-term peak (over 27,000 in both 1989 and 1990), before appearing to level off. However, the downward trend resumed from 1999 to 2015.

Government targets for reductions in the numbers of road accident casualties

Scotland's Road Safety Framework was launched in June 2009. It set out the vision for road safety in Scotland, the main priorities and issues, and included Scotland-specific targets and milestones which were adopted from 2010.

Article 1 provides details of progress against the Scottish national casualty reduction targets for 2020. It contains charts and tables for each of the five targets showing the main trends in casualty numbers in comparison to the 2004-08 baseline averages. It also shows the numbers that might be expected in each year up to 2020 if the targets were to be achieved by means of a constant percentage reduction in each year.

The figures are also used to report on the Scottish Government's Scotland Performs National Indicator¹: Reduce Deaths on Scotland's Roads. The current performance against this indicator shows performance improving, as the number of fatalities has fallen from 203 in 2014 to 168 in 2015.

Previous targets

In 1987 the UK Government adopted a target to reduce road casualties by one third from the 1981-85 annual average by the year 2000. The number of people killed on the roads in Scotland in 2000 was 49% below the 1981-85 average number of fatalities per year, and therefore the target of a one-third reduction by the year 2000 was exceeded for fatalities. For seriously injured casualties, the 2000 figure was 57% below the 1981-85 average, so the target was bettered for seriously injured casualties. However, the figure of 16,618 slight casualties in 2000 was only 9% below the 1981-85 average and so the target of a one-third reduction was not achieved for slight casualties. And, the total number of casualties in 2000 was 24% below the 1981-85 average, and therefore the target of a one-third reduction in the total number of casualties was not met.

In March 2000, the UK Government, the then Scottish Executive and the National Assembly for Wales announced a new national road safety strategy and casualty reduction targets for 2010. The number of people killed or seriously injured on the roads in Scotland in 2010 was 55% below the 1994-98 average, and therefore the target of a 40% reduction by the year 2010 was exceeded for fatalities. For children killed or seriously injured, the 2010 figure was 73% below the 1994-98 average, a greater reduction than the 2010 target of a 50% fall. The slight casualty rate of 25.67 casualties per 100 million vehicle kilometres in 2010 was 45% below the 1994-98 baseline average of 46.42 – a greater reduction than the 2010 target of a 10% fall.

Scottish fatal reported road accidents: 1972 onwards

showing likely range of values (see text) around 5-year moving average

Figure 3

Scottish reported road accident deaths: 1949 onwards

showing likely range of values (see text) around 5-year moving average

1.4 The likely range of random year-to-year variation in some road accident and casualty numbers for Scotland as a whole (see Figures 2 to 5)

Because road accidents may occur at random, the numbers of accidents, and the numbers of casualties in those accidents, can fluctuate from year to year. Figures 2 to 5 show, for Scotland as a whole, the numbers of:

- fatal road accidents (1972 to 2015);
- road deaths (1949 to 2015);
- people killed or seriously injured (1950 to 2015);
- children killed or seriously injured (1981 to 2015).

The number of years covered by each chart reflects the availability of the relevant figures. The black dots are the values in each year, and the black lines indicate the year-to-year variation. The grey dashed lines show the likely range of random year-to-year variation in the figures: based on statistical theory, one would expect that only about 5% of years would have figures outwith these ranges. Appendix G describes how these ranges were produced: the limits of the likely ranges of values are calculated in a similar way to 95% confidence intervals. It also explains why they cannot be produced for all years.

Fatal accidents, and deaths in road accidents (see Figures 2 and 3)

Figures 2 and 3 show that the number of fatal accidents is within its likely range of values in every year, and the number of road deaths is within its likely range of values in all but three years. These results are reasonable: one would expect a few years' figures to be outside the likely range of random year-to-year variation, given that there are over 30 years' figures for fatal accidents and over 50 years' figures for road accident deaths. Figures 2 and 3 therefore show that, despite the large percentage changes such as the falls in deaths of 19% between 1998 and 1999, and of 13% between 2001 and 2002, the figures almost always remain within the expected ranges. Hence, one should not put too much weight on a single large percentage change.

Killed or seriously injured (KSI) casualties (see Figure 4)

Figure 4 has many years' figures (around a third) outwith the calculated likely range of values. The reason for this is that *statistical variability is not the only reason for year-to-year changes* – other factors have contributed to sharp falls and rises in KSI casualty numbers. For example, the sharp fall shown in 1983 may be partly due to the introduction of seat belt wearing (for drivers and front seat passengers in most cars and light vans). Similarly, the sharp rise in 1994 may be due in part to the change in hospital practices where more casualties were kept in overnight for observation.

Such factors change the underlying rate of occurrence of accidents and/or casualties, and therefore, in effect, introduce a break into the series of moving average values. The method used to calculate the likely range of random variation cannot take account of the effect of such changes.

Only Figure 4 has figures outwith the calculated interval due to the likely ranges of random year-to-year variation calculated for small numbers being quite wide in percentage terms. This is because, for a Poisson process (see Appendix G), by definition, the greater the frequency of occurrence of events, the smaller the

Figure 4

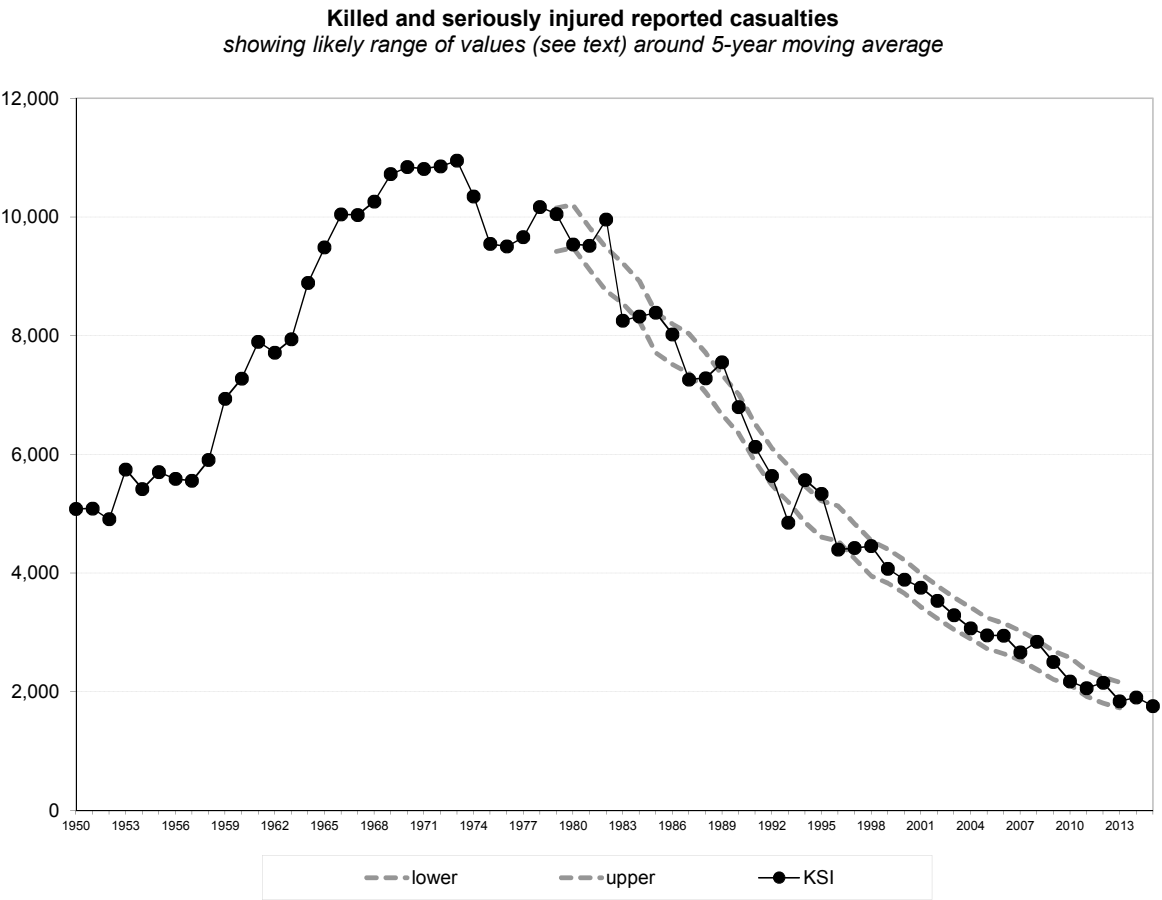

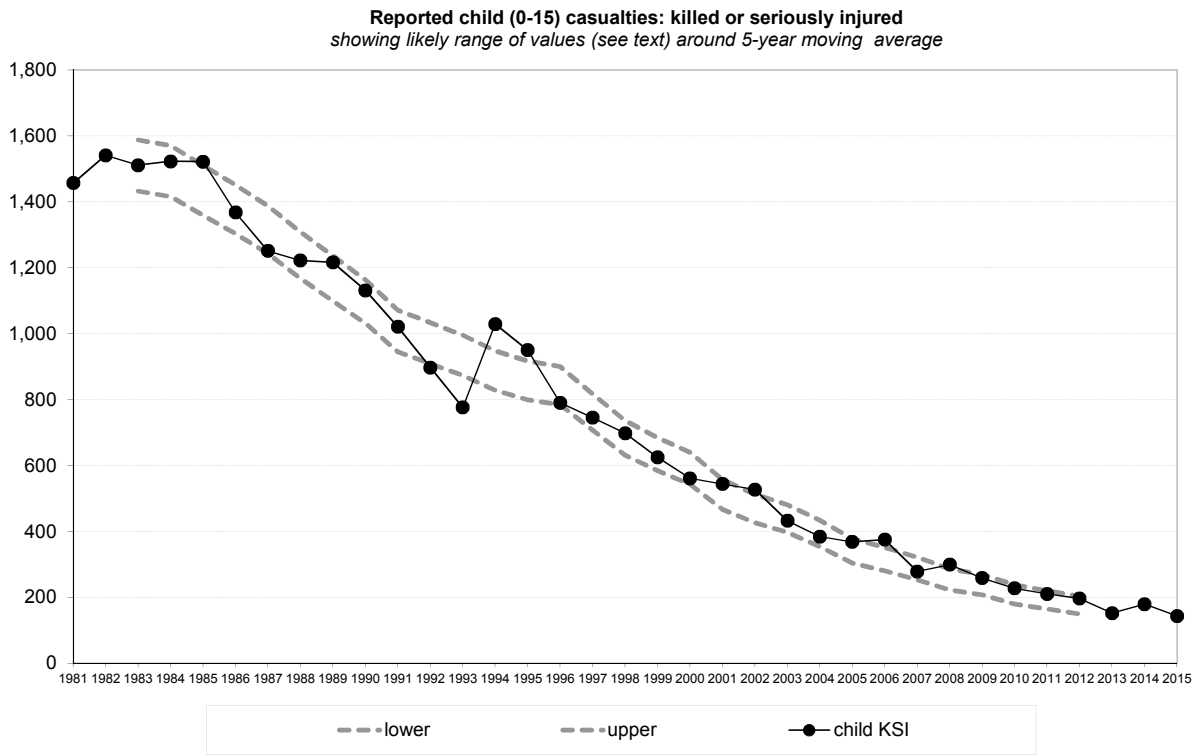

Figure 5

proportion that the standard deviation of the frequency (which is the square root of that number) represents of that number. For example:

- with 100 cases, the square root is 10 – or 10% of the value;
- with 400 cases, the square root is 20 – 5% of the value;
- with 10,000 cases, the square root is 100 – only 1% of the value.

As a result, if a factor (like the introduction of the compulsory wearing of front seat belts) were to cause the same percentage fall in each of the four types of accident and casualty numbers used in the charts, the following might be observed. The percentage fall could be *within* the relatively wide percentage range of likely random variation around the *smaller* numbers, but *outwith* the relatively narrow percentage range of likely random variation around the *larger* numbers. The ranges in Figures 2, 3 and 5 appear to be sufficiently wide to encompass the effects of changes such as those mentioned above. That is, the effects of the changes in their first years may fall within the likely range of random variation.

Of course, over the longer-term, such changes should make significant contributions to the reductions in casualty numbers and their severity. However, the intervals in Figure 4 include a much smaller than expected proportion of the figures. This is because the likely range of random variation for KSI casualties represents only a small percentage of the total, and factors like those mentioned above appear to have had a greater percentage effect than that in their first years.

Children killed or seriously injured (see Figure 5)

Figure 5 shows that the year-to-year fluctuations in the numbers of children killed or seriously injured (for the years for which figures are readily available) are generally within the expected ranges. The exceptions are around 1994, when health boards' policies changed, with the result that more child casualties were admitted to hospitals for overnight observation. This changed the classification of many injuries from slight to serious.

When changes in operational practice or to administrative processes have a marked effect on the statistics, the resulting year-to-year changes can be much greater than those expected to arise due to normal random year-to-year variation – so it is not surprising that there are figures outwith the expected ranges around 1994.

2. Reported Accidents

2.1 Accidents by road type and severity (see Table 4)

Table 4 shows separate figures for trunk roads and for local authority roads. Trunk roads accounted for only small proportions of the total numbers of accidents in 2015: 33% of fatal accidents, 18% of serious accidents, and 18% of all accidents. The trunk road network's shares of accident numbers in previous years were broadly similar.

Accident trends for different types of road will be affected by developments in the surrounding area (new city and town bypasses, construction of new roads with high average traffic flows etc.) Therefore, figures do *not* provide an accurate measure of the comparative change in the road safety performance of different types of road.

Several changes were made to the trunk road network with effect from 1st April 1996. Appendix E refers to them, and explains why the 1994-98 averages for trunk roads and for local authority major roads have been calculated by counting accidents which occurred prior to 1st April 1996 on the basis of whether they occurred on roads which were part of the post- 1 April 1996 trunk road network.

2.2 Accident rates (see Table 5)

Accident rates showing the number of accidents per 100 million vehicle kilometres are contained in parts (b) and (c) of table 5. These are calculated by dividing the numbers of accidents on each type of road by the estimated volumes of traffic on those roads, which were provided by the Department for Transport, and which are available for all types of road with effect from 1993. The five year average accident rates were calculated by dividing the total number of accidents which occurred in each five year period by the total of the estimated volumes of traffic for the same period, rather than by calculating the averages of the individual accident rates for the five years.

Accident rates have fallen markedly since the early 1990s. The overall fatal accident rate has dropped from 0.62 per 100 million vehicle kilometres in 2005 to 0.35 in 2015; the serious accident rate fell from 5.27 to 3.12; and the overall accident rate (all severities) reduced from 31.46 per 100 million vehicle kilometres to 18.68. Motorways had consistently lower accident rates than A roads. Leaving aside the relatively low rate for fatal accidents, minor roads (taken together as a group) tend to have higher accident rates than major roads, and accident rates tend to be higher for built-up roads (roads with speed limits of up to 40 mph) than for non built-up roads (ones with higher speed limits).

Part C of the table shows that estimated accident rates vary considerably by police force area. Some of this variation may be attributed to the distribution of traffic by road type within individual areas.

2.3 Accidents by month by road type (see Table 6)

The numbers of injury accidents over the years 2011-2015 were fairly evenly spread throughout the year, with minor peaks in August, September and November.

Serious accidents varied a little more between the months, and their peak, which occurred in September, was 16% above the monthly average. (Months are standardised to 30 days to allow comparison)

On average, there were 14 fatal accidents per month in the years 2011 to 2015. The number did not vary greatly between the months: the lowest average was 10, and the highest was 18.

2.4 Accidents by light condition and road surface condition (see Table 7)

The light and road surface conditions and the type of road (e.g. built-up) contribute to the severity of an accident. Severity rates are higher on non built-up roads than on built-up roads, likely due to the higher average speed. Severity rates are also higher in darkness than in daylight, likely due to poorer visibility.

For example, taking the annual averages for 2011-2015, 3.8% of injury road accidents on non built-up roads in darkness (34 out of 886) resulted in one (or more) deaths compared with 1.6% of accidents on built-up roads in darkness (25 out of

Figure 6

Reported casualties: Total and Slightly injured - from 1950

1,546) and 3.1% of accidents on non built-up roads in daylight (76 out of 2,448). Similarly, the percentage of accidents classified as serious is lower for built-up roads in daylight than for built-up roads in darkness.

Severity rates did not appear to be higher when the road surface condition was wet, damp or flooded, or affected by snow, frost or ice. For example, taking the annual averages for 2011 to 2015, the percentage of accidents on non built-up roads classified as serious when the road surface condition was dry was 22.9% (361 out of 1,576) compared with 17.6% (258 out of 1,463) when the surface was wet and 14.7% (43 out of 293) when it was affected by snow, frost or ice.

2.5 Car driver accident rates (see Table 18b)

This table includes all car drivers involved in injury accidents regardless of whether they were injured or not, on the basis of whatever information is known about their ages and their sex. For example, someone whose sex was known, but whose age was not known, will be included in the all ages total for the appropriate sex. The grand total includes those for whom neither the age nor the sex was known.

As the car driver accident rates that are shown for each sex and age group are on a per head of population basis, rather than being based upon the numbers of driving licence holders or upon the distance driven, they can provide only a general indication of the relative accident rates for each group. The statistics do *not* provide a measure of the relative risk of each group as car drivers, because they do not take account of the differing levels of car driving by each group.

Age & Gender

Car driver accident rates per head of population vary markedly by age and sex. In 2015, the overall rate was 2.4 per thousand population aged 17+. The peak occurs for males in the 17-25 age group, with a rate of 4.1 per thousand population in 2015. This rate is one and a half times those of females of the same age (2.7 per thousand in 2015).

The overall male car driver accident rate in 2015 was 2.9 per thousand population; slightly lower than 2014 but the rate for the 26-34 age group was slightly higher than the previous year. The overall female car driver accident rate in 2015 was 1.8 per thousand population and all age groups saw a slight reduction from the previous year.

Between 2005 and 2015, the male car driver accident rate fell from 5.2 to 2.9 per thousand population, while the female car driver accident rate has declined slowly from 2.7 per thousand population to 1.8 per thousand in 2015. As a result, the overall, ratio of male to female car driver accident rates has fallen from 1.9 : 1 for 2005 to 1.6 : 1 in 2015.

3. Reported Casualties

3.1 Casualties by type of road (see Table 23)

In 2015, non built-up roads accounted for two-fifths of the total number of casualties (40%: 4,351 out of 10,968). However, because speeds are higher on non built-up

roads than elsewhere (the definition is roads with a speed limit of more than 40mph), they accounted for almost three quarters of those killed (71%: 120 out of 168) and for just under half of the total number of seriously injured (47%: 725 out of 1,596).

Compared with 2005, the fall in the total number of casualties has been 42% for non built-up roads and 36% for those elsewhere. The difference in the numbers killed on non built-up roads is higher than those on built-up ones (down by 42% for non built-up roads compared with a reduction of 39% elsewhere). Over the years, some traffic will have been transferred away from built-up roads by the opening of city and town bypasses, and by the construction of non built-up roads with higher average traffic volumes. Therefore, these figures do *not* provide an accurate measure of the comparative change in the road safety performance of built-up and non built-up roads.

3.2 Casualties by mode of transport (see Table 23)

A total of 6,712 car users were injured in road accidents in 2015, representing 61% of all casualties. Of these car users, 75 died. There were 1,694 pedestrian casualties (15% of the total), of whom 44 died, 794 pedal cycle casualties (7% of the total), of whom 5 died, and 734 motorcycle casualties (7% of the total), of whom 27 died. Because of the numbers of car user, pedestrian, pedal cyclist and motorcyclist casualties, the figures for each of these four groups of road users are the subject of separate sections, which follow this one, and are followed by a section on child casualties, which gives details of their modes of transport.

Together, all the modes of transport other than the four mentioned above accounted for 1,034 casualties in 2015 (9% of the total), and for smaller percentages of the numbers of seriously injured. These included 332 bus and coach users injured in 2015, of whom 49 suffered serious injuries (one died). There were also 354 casualties who were travelling in light goods vehicles, 116 people in heavy goods vehicles, 136 users of taxis, 27 users of minibuses and 69 people with another means of transport.

3.3 Car user casualties

A total of 6,712 car users were injured in road accidents in 2015, representing 61% of all casualties. Of these people, a total of 639 were seriously injured, 75 died. Non built-up roads accounted for a half of all car user casualties (50%: 3,389 out of 6,712). Perhaps because average speeds are higher on non-built up roads, they accounted for much higher percentages of the total numbers of car users who were killed (88%: 66 out of 75) or were seriously injured (70%: 449 out of 639). (see Table 23)

The number of car users killed in 2015 was 20% less than the 2014 figure. The number who were seriously injured fell by 7% and the total number of casualties of all severities was down by 1%. Since 2005, the number killed has dropped by 51%, and there have been falls of 51% in the number who were seriously injured and of 39% in the total number of car user casualties. (see Table 23)

Looking at annual averages over the years 2011-2015, the casualty rate for 16-22 year old car users was 2.97 per thousand population. This was much higher than the

**Figure 7 Reported casualties: 5 year moving average
(1947-51 to 2011-15)**

rate for car users in the older age groups, which varied from 0.8 to 2.3 per thousand population. (see *Table 32*)

On average, over the years 2011-2015, 69% of car user fatalities occurred on roads with a speed limit of 60mph. Such roads accounted for 58% of those car users who were seriously injured, but for only 37% of the total number of car user casualties of all severities, where more casualties occurred on roads with a 30 mph limit (41%). (see *Table 33*)

Adult car users

On weekdays, the peak time for adult car user casualties was from 4pm to 6pm. The 5pm to 6pm average of 444 (the average over the years 2011-2015) was 26% higher than the average of 353 in the morning 8am to 9am peak. (see *Table 28*)

Adult car user casualties varied by month, with fewest in April and most in November. November had 17% more adult car user casualties than April (annual averages over the years 2011-2015; months standardised to 30 days). (see *Table 29*)

Friday had the peak numbers of adult car user casualties over the years 2011-2015 with 12% more than the average daily number of adult car user casualties. (see *Table 30*)

3.4 Pedestrian casualties

There were 1,694 pedestrian casualties in 2015: 15% of all casualties. Of these, 421 were seriously injured (44 died). Presumably due to the number of pedestrians and because of their greater vulnerability, a high proportion (26%) of the total number of people who were seriously injured were pedestrians. In addition, 25% of pedestrian casualties were seriously injured (421 out of 1,694) compared with an average for all modes of 15% (1,596 out of 10,968). 96% of pedestrian casualties occurred on built-up roads (1,623 out of 1,694) in 2015. A similar proportion of pedestrian casualties were seriously injured on non built-up roads (4%) and built-up roads (96%). (see *Table 23*)

The number of pedestrians seriously injured was slightly lower than 2014 and the overall number of pedestrian casualties was 3% lower. Since 2005, the number of pedestrians killed has fallen by 33%, the number who were seriously injured has dropped by 38%, and there has been a 44% reduction in the total number of pedestrian casualties. Looking at the annual average for the period 2011 to 2015, the pedestrian fatality rate was highest for those aged 70+ (0.02 per thousand population). However, the 12-15 age-group had the highest 'serious' and 'all severities' pedestrian casualty rates (0.19 and 0.93 per thousand population, respectively). The corresponding casualty rates for the 5-11 age-group were slightly lower. (see *Tables 23 & 32*)

The overall pedestrian 'all severities' casualty rate for males was 0.42 per thousand population, compared with 0.28 per thousand for females, using the averages for the period 2011 to 2015. (see *Table 34*)

Adult pedestrian casualties

On average in the period 2011 to 2015, the peak time for adult pedestrian casualties during the week was from 4pm to 6pm; at weekends it was from midnight to 2am. (see *Table 28*)

November and December were the peak months for adult pedestrian casualties, with each having 24-27% more than the monthly average. Adult pedestrian casualties in the four winter months, November to February, were 28% more than the monthly average (annual averages over the years 2011-2015; months standardised to 30 days). (see *Table 29*)

Friday and Saturday have the highest numbers of adult pedestrian casualties; respectively 24% and 13% more than the daily average over the period 2011 to 2015. (see *Table 30*)

3.5 Pedal Cycle Casualties

There were 794 pedal cycle casualties in 2015, 99 less than the previous year. The number of seriously injured pedal cycle casualties in 2015 was 164, 3% lower than in 2014. There were 5 pedal cycle fatalities in 2015, three less than 2014. Since 2005 there has been a 2% fall in all pedal cycle casualties, the number who were seriously injured has risen by 41%, and the number of fatalities has fluctuated between 4 and 16. In 2015, 87% of pedal cycle casualties were on built-up roads (see *Table 23*). But 63% of all fatalities over the last five years were on non-built up roads. It should be noted that pedal cycle traffic¹ is estimated to have increased by 41 per cent since 2005.

In terms of the averages for the period 2011 to 2015, the pedal cycle casualty rate per head of population was highest for those aged 30-39 (0.30 per thousand population) and 26-29 and 40-49 (0.25 and 0.26 per thousand respectively). Of course, it must be remembered that, as noted earlier, per capita casualty rates do not provide a measure of the relative risk, because they do not take account of the levels of usage of (in this case) pedal cycles. (see *Table 32*)

Adult pedal cycle casualties

Using the averages for the period 2011 to 2015, on weekdays, the peak numbers of adult pedal cycle casualties were from 4 pm to 7 pm and from 7 am to 9 am. At weekends the numbers were smaller, but appear to peak between mid-day and 2 pm. (see *Table 28*)

The peak months of the year for adult pedal cycle casualties were August and September which were 24-25% more than the monthly average (2011-2015 annual averages standardised to 30 days). (see *Table 29*)

The days of the week with the peak numbers of adult pedal cycle casualties were Tuesday and Wednesday, 22-26% higher than the daily average, over the years 2011-2015. There were substantially fewer adult pedal cycle casualties on Saturday and Sunday, with both being 31-37% less than the daily average. (see *Table 30*)

¹ Scottish Transport Statistics chapter 5 table 5.3

3.6 **Motorcyclist casualties**

A total of 734 motorcyclists were injured in road accidents in 2015, representing 7% of all casualties. Of these, 257 were seriously injured and 27 died. 46% of all motorcyclist casualties occurred on non built-up roads but (perhaps because of their higher average speeds) such roads accounted for almost 61% of those seriously injured, and 89% of those killed. (see *Table 23*)

The number of motorcyclist casualties in 2015 was 11% lower than in the previous year. The number killed fell by 3 and the number seriously injured decreased by 70. The total number of motorcycle casualties rose each year from 1999 to a peak in 2001; since then, it has tended to decline. As a result, the figure for all casualties in 2015 was 32% lower than in 2005. Seven less motorcyclists died in 2015 than in 2005. (see *Table 23*)

On average, over the years 2011 to 2015, the motorcyclist casualty rate was highest for the 16-22 and 40-49 year old age groups (0.32 and 0.26 per thousand population respectively), followed by 23-25, 0.25 per thousand population; other age-groups had smaller casualty rates. (see *Table 32*)

Looking at the averages for the period 2011 to 2015, the peak time of day for adult motorcyclist casualties was 4pm to 6pm on weekdays (see *Table 28*), the peak months of the year were June (100), with a longer peak from May to September (see *Table 29*) and there were more casualties at the weekend than on any of the other days (see *Table 30*).

3.7 **Child (0-15) casualties**

There were 972 child casualties in 2015, representing 9% of the total number of casualties of all ages. Of the child casualties, 139 were seriously injured, and 4 died (see *Table 24*).

There were three less children killed in 2015 than in 2014 and a fall of 19% in the number of children seriously injured. The total number of child casualties fell by 6% since 2014. Since 2005, the number of children killed has fallen by seven and there has been a reduction of 61% in child seriously injured casualties. (see *Table A and Table 25*)

In terms of the averages for the period 2011 to 2015, on weekdays, the peak time for child casualties was from 3pm to 5pm, with 29% of all weekday casualties in those two hours. A further 26% occurred in the three hours between 5pm and 8pm. There was a smaller peak in the morning, between 8am and 9am. There was no real clear peak at weekends: the numbers of casualties were very broadly the same each hour from 12 noon to 7pm (see *Table 27*)

August was the peak month for child casualties, with 24% more than in an average month. June and September had 10% and 17% more than an average month respectively. (2011-2015 annual averages standardised to 30 days). (see *Table 29*)

Using the averages for 2011 to 2015, Friday was the peak day of the week for child casualties, with 26% more than an average day. Sunday, on the other hand, had 24% less than an average day. (see *Table 30*)

Child (0-15) casualties by mode of transport

In 2015, there were 460 child pedestrian casualties. They accounted for 27% of all pedestrian casualties of all ages (460 out of 1,694). Of the child pedestrian casualties, 97 were seriously injured and 3 died. (see *Table 24*)

There were 71 child pedal cycle casualties in 2015 (9% of the total of 794 pedal cycle casualties of all ages). The child pedal cycle casualties included 11 who were seriously injured, one died. (see *Table 24*)

In 2015, there were 378 child casualties in cars, 6% of the total number of car user casualties of all ages (378 out of 6,712). Of the child casualties in cars, 27 were seriously injured (none died). (see *Tables 23 and 25*)

Child (0-15) casualty rates (per head of population)

Children's casualty rates (per head of population) increase with age: using the averages for the years 2011-2015 taken together, for children aged 0-4 the rate was 0.60 per thousand population, whereas it was 1.32 per thousand for those aged 5-11 and for the 12-15 age group it was 1.82 per thousand. The pedestrian casualty rate for younger children (0-4 years) was 32% of those for 5-11 and 22% of the 12-15 year old rate. (see *Table 32*)

The pedestrian casualty rate for boys seriously injured in the 0-4 age group was 60% more than that for girls. The difference between the sexes was even more pronounced in the case of the driver or rider casualty rates, particularly for the 12-15 age group. (see *Table 34*)

The overall child pedestrian casualty rates for seriously injured and for all severities, at 0.13 and 0.57 per thousand child population respectively, were almost two times higher than the corresponding rates for adult pedestrian casualties. (see *Table 32*)

3.8 Casualty rates for local authority roads by local authority area, and the likely range of random year-to-year variation in these figures(see Appendix H)

There can be some large percentage year-to-year fluctuations in the numbers of some types of casualty for local authority areas. In order to illustrate this, the table and charts in Appendix H were initially prepared in 2006 and published in *Road Accidents Scotland 2005*. They have now been updated using data for 2011 to 2015. They provide the following overall casualty rates (calculated per 100 million vehicle kilometres) for local authority roads in each local authority area for 2013:

- (all ages) killed casualty rate;
- (all ages) seriously injured casualty rate;
- child killed and seriously injured casualty rate(combined in one chart due to small numbers);
- slight casualty rate

These figures were calculated (or taken) from the data in two of the tables in this publication:

- the numbers of children killed and seriously injured, and the total number of people killed and seriously injured – Table 40; and
- the number of slight casualties, the estimated volume of traffic (in millions of vehicle kilometres) and the resulting slight casualty rate – Table 41.

The table in Appendix H also shows the likely upper and lower limits of the ranges within which these casualty rates would be expected to fall, given the likely random statistical variation that might affect the number of casualties in that year. Based on statistical theory, one would expect that the actual figures would be outwith these ranges in only about 5% of cases. The text in Appendix H describes how the ranges were calculated, using the annual averages for 2011 to 2015, as that is the five year period centred on 2013 (the year to which the casualty rates relate). That is why the table and charts are not for 2015: the calculation of ranges for 2015 would require the annual averages for 2013 to 2017. When the table and charts were prepared, 2013 was the latest year for which data were available.

The charts which accompany the Appendix H table show the actual casualty rates for 2013, casualty rates based upon the 2011-2015 annual averages, and the likely ranges of values within which the 2013 rates might fall, given the likely levels of random statistical variation in that year (calculated from the 2011-2015 annual averages). The 2013 rates are identified by black diamonds, the rates based upon the 2011-2015 annual averages by small circles, and the likely ranges of values by the thin bars which extend to either side of the small circles. (In any case where the 5 year average is zero, there is *no* likely *range* of values as, by definition, the value for 2013 could only be zero). For example, the slight casualty rate chart shows that (for local authority roads in 2013):

- Orkney Islands had the lowest slight casualty rate (9 per 100 million vehicle-kilometres) and Glasgow the highest (63 per 100 million vehicle kilometres), as can be seen from the table;

- In the case, of Glasgow table 41 shows that, in 2013, they had a lower number of slight casualties than their 2011-2015 annual average numbers, whereas East Lothian had a slightly higher number than their 2011-2015 annual average;
- Orkney and Shetland had the widest likely ranges of values. This is due to their having relatively few slight casualties (2011-2015 annual averages of 20 and 34, respectively). The smaller the casualty numbers are, the greater in *percentage* terms the potential random year-to-year variation (this is discussed in Section 1.4 and Appendix G). Edinburgh and Glasgow have much narrower likely ranges of values, because their numbers of slight casualties on local authority roads are much larger (2011-2015 annual averages of 1,110 and 1,201 respectively). The Scotland figure (at the foot of the chart) has a very narrow likely range of values, because it is based on an annual average of 8,116 in 2010-14.
- Few local authorities had slight casualty rates that were markedly outwith the likely range of values;
- Glasgow City had a slight casualty rate (54 per 100 million vehicle-kilometres) which was noticeably below the lower limit (of 56 per 100 million vehicle-kilometres) of the estimated likely range of values – in other words, the slight casualty rate that year was unusually low, compared with what would have been expected on the basis of the casualty numbers for the five-year period.

4. Motorists, breath testing and drink-driving

4.1 *Breath testing of drivers (see Tables 19, 20 and 21)*

These tables cover all motorists who were known to be involved in injury road accidents (e.g. excluding those untraced drivers involved in hit and run accidents). Here, a motorist is defined as the driver or the rider of a motor vehicle (e.g. motorcycle)

In 2015, 57% of motorists involved in injury accidents were asked for a breath test (this ranged from 42% to around 74% across the police force divisions). The breath test proved positive (or the motorist refused to take the test) for 2.9% of those drivers breathalysed. This represented 1.6% of the total number of motorists involved (including those who were not asked for a breath test). There has been a general downward trend in these percentages in the last couple of years as seen in table 19.

Tables 20 and 21 show the time and day of the accident (Table 20) and for a number of years (Table 21). Table 21 shows that, in 2015, of the 228 positive / refused cases, 33% occurred between 9pm and 3am [8% between 9pm and midnight, plus 25% between midnight and 3am.] Table 20 shows that, using 2011 to 2015 averages, the number of positive / refused cases, expressed as a percentage of motorists involved in accidents, was highest (at around 15%) between midnight and 6am, but varied depending upon the day of the week, from 7% (the average for 3am to 6am for Mondays to Thursdays) to 16-20% (3am to 6am on Saturdays and Sundays). Table 20 shows that although the period from 9pm to midnight had the second highest number of positive / refused cases, the equivalent percentages were not as high, because between 9pm and midnight there were many more motorists involved in accidents than between midnight and 3am.

4.2 *Drink-drive accidents and casualties (see Table 22)*

Table 22 shows the estimates (made by the Department for Transport) of the numbers of injury road accidents involving illegal alcohol levels. They are higher than the number of drivers with positive breath test results (or who refused to take the breath test) because they include allowances for the numbers of cases where drivers were not breath tested because of the severity of their injuries, or because they left the scene of the accident. Information about the blood alcohol levels of road users who died within 12 hours of being injured in a road accident is supplied by the Procurators Fiscal.

The estimates show that the numbers of drink-drive accidents fell by 52% and the number of casualties by 57% between 2004 and 2014 (the latest year for which estimates are available): from a rounded estimate of 710 to roughly 340 (accidents) and from around 1,060 to some 460 (casualties). While fluctuating from year to year, the number of people killed as a result of drink-drive accidents is estimated to have halved, from about 40 in 2004 to around 20 in 2014. The number of serious casualties is estimated to have dropped by three fifths (from roughly 170 in 2004 to some 70 in 2014).

5. Comparisons of Scottish figures against those of other countries

5.1 *Casualty rates: against England & Wales (see Tables C to F on the pages which follow)*

Historically, killed and seriously injured casualty rates per head of population in Scotland have been above those for England & Wales, whereas the total casualty rate is usually lower in Scotland than in England & Wales. In 2015, Scotland's casualty rates were 15% higher (killed), 16% lower (serious) and 33% lower (all severities).

Child rates

In 2015, the Scottish rates were 6% lower (serious) than those in England and Wales and 23% lower (all severities). In the case of serious and all casualties this represented an improvement in Scotland's figures relative to England & Wales (compared with the 2004-08 average).

Due to the relatively small number of fatalities a 5 year average is used for comparison here. In the period 2011-2015, child fatality rates in Scotland were on average 39% higher than England and Wales, however, in 2 of the five years the rates were lower.

It should be noted that the ratio of the fatality rates for Scotland and for England and Wales can fluctuate markedly from year to year, particularly for the child fatality rates due to the relatively small numbers in Scotland, (which may be subject to year-to-year changes which are large in percentage terms). Therefore, subsequent paragraphs do not refer to the fatality rates for children using different modes of transport. In addition, it should be remembered that the rates for some other sub-groups may be affected by year-to-year fluctuations: for example, the numbers are relatively small for most categories of child killed and seriously injured casualties in Scotland.

Mode of transport

The casualty rates of car users in Scotland have for many years been substantially higher than those of England & Wales for killed and seriously injured casualties, while for all severities the rate has been much lower. In 2015, Scotland's car user fatality rate was 18% higher than that of England & Wales, the seriously injured rate was 5% lower, while the all severity car user rate was 31% lower. For child car users, the seriously injured rate was 13% higher in Scotland and the all severities rate was 31% less than that of England and Wales.

In 2015, the pedestrian killed rate per capita was 29% higher in Scotland than England & Wales, and the serious and all severities rates were the same and 18% lower respectively. The child pedestrian casualty rates in Scotland were the same (seriously injured) and 6% lower (all severities) compared to those for England & Wales.

Pedal cyclists casualty rates (all ages) in Scotland were substantially lower than in England & Wales in 2015 for seriously injured (43% lower) and for all severities (53% lower). The child pedal cycle casualty serious and all severities rates were also lower in Scotland than in England & Wales. These differences may reflect the fact that, according to the National Travel Survey, on average, people in Scotland do not travel as far by bicycle as people in England and Wales.

Further information about the numbers of casualties in England and Wales, and for Great Britain as a whole, can be found in *Reported Road Casualties Great Britain 2015*, which is published by the Department for Transport.

5.2 Road deaths: International comparison 2014 & 2015 (provisional) (see Tables G and H)

Introduction

This section compares Scotland's road death rates in 2014 and 2015 (provisional) with the fatality rates of some countries in Western Europe and some developed countries world-wide. The comparisons involve a total of up to 43 countries (including Scotland, and counting *each* of the UK, Great Britain, England, Wales and Northern Ireland as an individual country). The fatality rates were calculated on a per capita basis (the statistics given are rates per million population), and the countries were then listed in order of their fatality rates in Table G sections (a), (b), (c) and (d). In cases where two countries appear to have the same rate, the order takes account of decimal places which are not shown in the tables. A table of car user fatality rates which were calculated on a per motor vehicle basis is no longer shown due to a lack of consistent data.

Tables G and H were provided by the Department for Transport, which obtained the figures for foreign countries from the International Road Traffic and Accident Database (IRTAD) Web site, the address of which is:

<http://www.internationaltransportforum.org/jtrc/safety/safety.html>

In accordance with the commonly agreed international definition, most countries define a fatality as being due to a road accident if death occurs within 30 days of the accident. However, the official road accident statistics of some countries limit the fatalities to those occurring within shorter periods after the accident. The numbers of

deaths, and the death rates, which appear in the IRTAD tables take account of the adjustment factors used by the Economic Commission for Europe and the European Conference of Ministers of Transport to represent standardised 30-day numbers of deaths.

Latest Results

In 2015, Scotland's provisional overall road death rate of 30 per million population was the fifth lowest of the 37 countries surveyed (counting each of Scotland, England, Wales and Northern Ireland as a separate country, but *not* counting the overall GB and UK figures).

Pedestrians

In 2014, Scotland's pedestrian fatality rate was 9 per million population. Scotland ranked twenty second of the 36 countries for which figures are available (again counting Scotland, England, Wales and Northern Ireland separately, and again *not* counting the GB and UK figures).

Car Users

When the car user fatality rate is calculated on a per capita basis, Scotland has a car user fatality rate of 18 per million population: the twelfth lowest of 36 countries, again *not* counting the GB and UK figures.

Age

The fatality rates per head of population for up to 36 countries (including Scotland, England, Wales and Northern Ireland as separate countries, but not counting the overall GB and UK figures) are shown, for each of four broad age-groups, in Table H. Again, the ordering takes account of decimal places not shown in the table. In most cases, Scotland has one of the lowest rates per capita. However, the Scottish rate is the twenty first lowest for casualties aged 0-14. It was the tenth lowest for those aged 15-24, thirteenth lowest for those aged 25-64 and seventh lowest for 65+ (in each case, *not* counting the overall GB and UK figures).

International comparisons of road safety are based on road death rates, as this is the only basis for which there is an international standard definition. As indicated above, the OECD IRTAD tables provide comparable figures for each country, after making adjustments to the data for countries which do not collect their figures on the standard basis. One should not try to compare different countries' overall road accident casualty rates (i.e. the total numbers killed or injured, relative to the population of each country) because there is no internationally-adopted standard definition of an injury road accident. There are considerable differences between countries in the coverage of their injury road accident statistics. For example, many countries count only accidents which result in someone being admitted to hospital – so their figures would not include the kinds of accident which, in Britain, are classified as causing only slight injuries or certain types of serious injury. Because many countries' definitions of injury road accidents are much narrower than the definition used in the UK, their reported numbers of injury road accidents will appear low relative to ours – so comparing the reported numbers of people injured in road accidents may provide a misleading impression of different countries' road safety records.

1 In accordance with the commonly agreed international definition, most countries define a fatality as one being due to a road accident where death occurs within 30 days of the accident. The official road accident statistics of some countries however, limit the fatalities to those occurring within shorter periods after the accident. Numbers of deaths and death rates in the above table have been adjusted according to the factors used by the Economic Commission for Europe and the International Transport Forum (ITF) (formerly known as ECMT) to represent standardised 30-day deaths: Italy (7 days) +8%; France (6 days) +5.7%; Portugal (1 day) +14%; Republic of Korea (3 days) +15%.

Article 1

Casualty Reduction Targets: Scotland's Road Safety Framework to 2020

Figure 8 Progress towards the 2020 casualty reduction targets

Article 1: Casualty Reduction Targets: Scotland's Road Safety Framework to 2020

1. Introduction

Scotland's Road Safety Framework was launched in June 2009. It set out the vision for road safety in Scotland, the main priorities and issues and included Scotland-specific targets and milestones which were adopted from 2010.

Target	2015 milestone % reduction	2020 target % reduction
People killed	30%	40%
People seriously injured	43%	55%
Children (aged < 16) killed	35%	50%
Children (aged < 16) seriously injured	50%	65%

Each reduction target will be assessed against the 2004-08 average. In addition to the targets a 10 per cent reduction target in the slight casualty rate will continue to be adopted.

The four main targets differ to previous targets in that deaths have been separated out from serious injuries as, in recent years, trends have been different – serious injuries falling steadily but deaths declining at a lower rate.

The targets are deliberately challenging, particularly for child deaths as the child fatality rate in Scotland is higher than in England and Wales. The child fatality target itself will be monitored using a 3 year rolling average due to the small numbers of fatalities each year.

To illustrate the reductions necessary the following table shows the 2004 to 2008 baseline, the latest position as well as the level of casualties inferred by the 2015 milestones and 2020 targets.

	2004-2008 average	2015	2015 milestone	2020 target
People killed	292	168	204	175
People seriously injured	2,605	1,596	1,484	1,172
Children (aged < 16) killed	15	7 ¹	10	8
Children (aged < 16) seriously injured	325	139	163	114

1. 2013-15 average

Charts showing indicative lines of progress are in figure 8. More detail about the calculation of these indicative lines is included in section 5 of this article.

2 Summary of Progress

The 2015 figures show:

- 168 people were reported as killed in 2015, **42 per cent (124) below the 2004-2008 average** of 292 – so the reduction seen to date exceeds the 2015 milestone.
- 1,596 people were reported as seriously injured in 2015, **39 per cent (1,009) below the 2004-2008 average** of 2,605. The number of people seriously injured remains above the 2015 milestone.
- 4 children were reported as killed in 2015, an average of 7 a year in the 2013-2015 period, **57 per cent (8) below the 2004-2008 average** of 15. The level of reduction seen to date exceeded the 2015 milestone and 2020 target of a 50 per cent fall.

- 139 children were reported as seriously injured in 2015, **57 per cent (186) below the 2004-2008 average** of 325, but above the 2015 milestone.
- The slight casualty rate of 20.28 casualties per 100 million vehicle kilometres in 2015 was **38 per cent below the 2004-2008 baseline** average of 32.47.

Figure 8 shows progress towards the casualty reduction targets for 2020.

3 Modes of Transport

Table 1b shows progress against the 2020 targets by mode of transport.

Numbers killed

As shown in Table 1a below, a reduction of 30 per cent compared to the baseline was required in 2015 to reach the target. The overall reduction seen between the baseline and 2015 was 42 per cent.

Car fatalities are down 54 per cent on the baseline which exceeds the 2020 target.

Numbers Seriously Injured

As shown in Table 1a below, a reduction of 43 per cent compared to the baseline was required in 2015 to reach this target. The overall reduction for 2015 is 39 per cent, therefore just above the trajectory required to meet the target.

Table 1b shows that car and bus & coach injuries have fallen by a greater percentage than that implied as needed by the trajectory. The numbers of car drivers and passengers seriously injured has fallen by 49 per cent since the baseline. All other modes except pedal cycles have seen a fall when compared to the baseline.

Children killed

The number of child fatalities is relatively small and the average of 7 over the last three years is above the 50 per cent reduction target set for 2020. Table 1b shows that the average number of child fatalities for 2013-2015 for each mode is below the 2004-2008 baseline.

Child pedestrian fatalities have fallen from an average of 6 per year in 2004-2008 to an average of 4 per year in 2013-2015. Pedal Cycle fatalities has fallen from an average of 2 per year in the baseline period to an average of 1 in the last three years. The number of fatalities as passengers in cars has fallen as well from an average of 6 per year in the baseline period to 2 per year in the 2013-2015 period,.

Children seriously injured

As shown in Table 1a below, a reduction of 50 per cent compared to the baseline was required in 2015 to remain on the trajectory for this target. The overall reduction for 2015 is 57 per cent; above the trajectory.

Table 1b shows that all modes of transport apart from bus/coach serious injuries have fallen by a greater percentage than that implied by the trajectory. .

Slightly injured casualties

Because of the limited availability of detailed reliable road traffic estimates for Scotland, Table 1b shows the *numbers* of slight casualties (rather than slight casualty *rates*) for categories of road user. The table also shows the overall total volume of traffic and the overall slight casualty rate.

Table 1b shows that slight injuries per million vehicle kilometres are 38 per cent below the 2004-2008 average.

Apart from pedal cycles, the number of slight casualties has fallen compared to the baseline for all modes of transport. The largest reductions are seen for bus / coach, pedestrian, cars and 'other', 59 per cent, 42 per cent, 35 per cent and 52 per cent respectively. Car users make up almost two thirds of slight casualties and there has been a reduction of a just over a third compared to the baseline period. Pedal cycles on the other hand have shown an 2 per cent increase on the 2004-2008 average. There is some evidence to suggest that this increase is smaller than the increase in cyclists on the road over the same period.

4. Other statistics for monitoring progress

Table 40 in the main section of this publication shows the baseline figures for each local authority area for the four targets relating to numbers killed and seriously injured (separately for trunk roads, local authority roads and all roads), along with the corresponding figures for each of the past 10 years and the latest five years' averages. **Table 41** provides figures for each local authority area related to the numbers slightly injured, and **Table 42** shows figures for each Police Force division related to all five targets. In addition, many other tables include the 2004-2008 baseline averages.

5. Assessing progress towards the casualty reduction targets

One way of assessing progress towards the targets is to compare actual casualty numbers in each year with an indicative line that starts at the baseline figure in 2006 (mid point of the 2004 to 2008 average) and falls, by a constant percentage reduction in each subsequent year, to the milestone for 2015 and from there to the target for 2020. This is the approach adopted by the GB Road Safety Advisory Panel. The indicative line starts at the baseline figure in 2006 as that is the middle year of the baseline period. Other approaches could have been used: there are many ways of producing lines that indicate how casualty numbers might fall fairly steadily to the targets for 2020.

The method adopted to produce the indicative target lines shown in Figure 8 involves a constant percentage reduction in each year after 2006 to the 2015 milestone, then a constant percentage reduction between 2015 and 2020. The resulting indicative target lines represent the percentages of the baseline averages which are shown in the table below. They are not straight lines, because of the compounding over the years effect of constant annual percentage reductions (to two decimal places, the falls are: 3.89% per annum for killed to meet the 2015 milestone and 3.02% between 2015 and 2020). For seriously injured casualties the falls are 6.06% and 4.61%. For child killed 4.67% and 4.37% or children seriously injured 7.41% and 6.90%.

Table 1a Constant percentage reductions needed to achieve 2015 and 2020 targets

	Killed		Serious		Child killed		Child serious

Article 2: Contributory Factors

Article 2. Contributory factors to reported road accidents

Summary

This article describes the scope and limitations of the information on contributory factors collected as part of the road accident reporting system and presents Scottish results from the eleventh year of collection.

- **Driver/rider errors or reactions** were reported in 66 per cent of **all** reported accidents with *failed to look properly* the most common type (involved in 31%).
- **Travelling too fast for the conditions** or **excessive speed** was reported in 11% of all reported accidents and 19% of fatal accidents.
- **Pedestrian only** factors were reported in 22% of **fatal** accidents whilst **loss of control** and **failed to look properly** were the most frequently reported driver/rider factors (involved in 39% and 25% of fatal accidents respectively).

1. Introduction

1.1 From 2005, all police forces across Great Britain reported contributory factors as part of the stats19 collection. These were developed to provide insight into why and how road accidents occur. Their aim is to help identify the key actions and failures that led directly to the actual impact: to aid investigation of how it might have been prevented. Care should always be taken when interpreting the factors as they:

- **reflect the reporting officer's opinion at the time of reporting the accident** (or the opinion of a person whose duties include deciding which CFs should be recorded based on the officer's report).
- are based on the information which was available at that time, so **may not be the result of subsequent extensive investigation** (indeed, subsequent enquiries could result in the reporting officer's opinion changing).

1.2 A reporting office attending the scene of a road accident may select up to 6 contributory factors (from a list of 77) to assign to that accident. Multiple factors may be listed against any participant or vehicles in the accident, (therefore percentages in the tables provided may not sum to 100).

1.3 Because of this, analysis of contributory factor information requires careful consideration; figures will differ depending on the focus of the analysis. Care should be taken when interpreting tables provided here which consider different aspects of the data (i.e. accidents, vehicles/participants, casualties and frequencies).

1.4 This article presents analysis from accidents in Scotland reported to the police in 2014, with the following background note describing the collection of the contributory factor system in more detail.

1.5 Note that most tables are by individual contributory factor so care needs to be taken when carrying out analysis. Adding together numbers for individual contributory factors will result in some double counting e.g. some accidents will have 'exceeding speed limit' and 'driving too fast for the conditions' recorded as a factor.

2. Accidents

Categories

2.2 Each of the 77 contributory factors fits into one of nine categories. Figure 11 shows the percentage of accidents reported to the police with associated contributory factors in each these categories.

- **Driver/rider error** was the most frequently reported category for each type of severity of accident and was reported in 66 per cent of accidents reported to the police).
- **Pedestrian** contributory factors (where the factor has been attributed to an injured or uninjured pedestrian involved in the accident), were reported in 14 per cent of reported accidents, rising to 22 per cent of fatal accidents.
- **Injudicious action** (including *travelling too fast for conditions*, *following too close* or *exceeding speed limit*) was involved in 19 per cent of all reported accidents, increasing to 23 per cent of fatal accidents.
- **Road environment** factors were reported in 19 per cent of reported accidents.

Figure 11: Contributory factor type: Reported accidents by severity, 2015

Factors

2.3 On average there were more than two contributory factors listed per reported accident with more factors recorded for fatal accidents and fewer for slight accidents. Table M shows the numbers (and percentages) of reported accidents in which each contributory factor was reported.

- ***Failed to look properly*** was the most frequently reported contributory factor, involved in 31 per cent of all reported accidents. This was followed by *failed to judge other person's path/speed* (19%) and *loss of control* (16%). *Careless/reckless or in a hurry* (14%), *slippery road* (13%) and *poor turn/manoeuvre* (12%), were also in the top six.
- ***Travelling too fast for the conditions*** or ***excessive speed*** was reported in 11% of all reported accidents and 19% of fatal accidents (Note that the individual percentages for each of these factors cannot simply be added together to obtain combined totals.)
- For fatal accidents, ***loss of control*** was the most frequently reported driver/rider factor involved in 39% of accidents. *Failed to look properly* was reported in 25%, *careless / reckless /in a hurry* in (18%) and *poor turn or manoeuvre* in 15%. *Pedestrian failed to look properly and failed to judge other persons path/speed* were both involved in 13% of fatal accidents respectively.

2.4 Table M also shows how the incidence of some CFs varies with the severity of the accident. For example: loss of control is cited in 16% of all accidents for which CFs were recorded but 39% of fatal accidents; slippery road due to weather is cited in 13% of all accidents but 7% of fatal ones; travelling too fast for the conditions is cited in 8% of all accidents but 11% of fatal ones and exceeding speed limit is cited in 4% of all accidents but 10% of fatal ones.

2.5 Note that repeats of the same contributory factor within an accident are excluded from the table however an accident will appear more than once if more than one different contributory factor is reported.

Changes over time

2.6 Table N compares the top 10 contributory factors listed in 2015 against previous years. The ten factors remained the same in all five years, though the order and frequency changed over the 11 years of collection. The most frequently recorded factor, *failed to look properly is associated with a larger proportion of* accidents in 2015 than when the CF system was introduced in 2005.

2.7 It's not currently possible to identify whether changes are a result of reporting officers developing their understanding of the new system or a genuine change in the kinds of factors contributing to accidents reported to the police.

3. Vehicle & pedestrians

3.1 Table O shows the number and percentage of vehicles assigned each type of contributory factor (for each vehicle involved in an accident reported to the police). Table P shows this for pedestrians only.

3.2 Tables O & P show that:

- *Failed to look properly* was the most frequently reported factor both overall (reported in 18% of all vehicles' factors), and for every vehicle except motorcyclists.

- Loss of control (21%) was the most commonly reported factor for **motorcyclists**.
- *Failed to judge other person's path/speed* was the second most common factor reported for **cars or taxis** (12%).
- *Failed to judge other person's speed* was the second most common factor associated with **cyclists** (associated with 6% of bicycles).
- *Failed to judge other person's speed/path* was the second most common factor reported for **good vehicles** (reported in 14%).
- *Travelling too fast for the conditions* was associated with a total of 4% of all vehicles involved in reported accidents.
- **Pedestrians** involved in accidents were most likely to have *failed to look properly* as an associated contributory factor (recorded in 48% of all pedestrians), followed by careless/reckless or in a hurry (18%), failed to judge vehicle speed/path (14%), crossed road masked by stationary/parked vehicle and impaired by alcohol (both 12%).

3.3 Table O also shows that many contributory factors were rarely recorded for most vehicles, for example:

- **loss of control** was recorded for 21% of motorcycles but only 4% of vehicles in the bus/coach/minibus grouping;
- **sudden braking** was recorded for 9% of buses but for only 3% of all vehicles involved.

3.4 On average, fewer contributory factors were recorded for pedal cycles (an average of 0.65 per cycle involved in a reported accident) and bus or coaches (an average of 0.73), compared to an overall average of 1.08 factors per vehicles.

3.5 Note that percentages differ from Tables M & N which presents the percentage of accidents with each contributory factor. As more than one vehicle may be involved in an accident, the average number of factors associated with an individual vehicle is generally lower.

Pairing of factors

3.6 Table Q shows the most frequent pairs of contributory factors assigned to the same reported road accident participant in 2015.

- The most frequently-occurring combination is *driver/rider failed to look properly + (driver/rider) failed to judge other person's path/speed*, which was recorded on 669 occasions.
- As would be expected, the CFs identified (earlier) as most frequent to appear in several of the most frequently-occurring combinations – for example, (driver/rider) failed to look properly occurs in the first three of the most frequently-occurring combinations.

3.7 However, the numbers indicate that even the most frequently-occurring combination of CFs arose in only a small proportion of all accidents.

4 Casualties

4.1 Tables R & S show the number (and percentage) of fatal and seriously injured casualties involved in accidents where each contributory factor was reported. Unsurprisingly the pattern is similar to that seen in Tables M & N showing the number of accidents with each factor reported. Comparison shows that accidents with *pedestrian only* factors reported had lower numbers of casualties per accident.

4.2 Note a casualty will appear in the tables against each (unique) factor associated with the accident (resulting in the casualty) and therefore may appear more than once. As with the accident tables, repeats of the same contributory factor within an accident are excluded.

Fatalities

4.3 Table R shows the Contributory Factors associated with the largest numbers of deaths were:

- loss of control – 63 deaths (38%);
- (driver/rider) failed to look properly – 39 deaths (representing 23% of all deaths in accidents for which CFs were recorded);
- (driver/rider) poor turn or manoeuvre - 28 deaths (17%)
- (driver/rider) careless / reckless / in a hurry - 28 deaths (17% of fatalities)
- pedestrian failed to look properly – 21 deaths (13%)
- travelling too fast for the conditions – 20 deaths (12%)

Seriously injured

4.4 Table S shows the CFs associated with the largest numbers of serious injured were:

- (driver/rider) failed to look properly – 387 serious injuries (26%);
- loss of control – 330 serious injuries (representing 22% of all serious injuries in accidents for which CFs were recorded);
- failed to judge other person's path/speed– 215 (14%)
- pedestrian failed to look properly – 212 (14%)
- (driver/rider) careless / reckless / in a hurry – 206 (14%);
- poor turn or manoeuvre– 170 (11%)

5 Overall frequencies of recording

5.1 In 2015 at least one contributory factor was recorded in 99.9% of reported accidents where a police officer attended the scene (7,129) - there were 5 accidents without a contributory factor. A total of 15,379 factors were recorded, resulting in an average of 2.2 factors per accident.

5.2 Around 88% (13,469) of all factors listed were related to vehicles (and their drivers/rider) and the road environment. Around 11% (1,753) were related to pedestrians who were casualties. Relatively few were uninjured pedestrians (73 or 4.2%).

5.3 Table T presents a ranking of all 77 factors by the frequency of reporting in 2015. (Note that figures differ from earlier tables as repeats of factors within the same accident are counted). It is apparent that some CFs are not used often – for example, many were used fewer than 100 times.

5.4 Note that data relating to all reported CFs were used to produce Tables O to T. In cases where the same CF applies to more than one vehicle in the same accident, it is counted once for each of them. These tables therefore differ from Tables M & N (which exclude repeats of the same CF within an accident).

Possible vs. Very likely

5.5 Reporting officers record whether it was thought **very likely** or just **possible** that a factor contributed to the occurrence of the accident. Table T also shows how often each CF was described as very likely, and how often as possible.

5.6 Overall, almost two thirds of CFs (67%) were described as very likely, but the percentage varied markedly between different CFs. Excluding those used fewer than 100 times, the following were described as **very likely** on at least 83% of occasions on which they were used:

- Disobeyed Give Way or Stop sign or marking (86%)
- Pedestrian crossed road masked by stationary/parked vehicle (83%)
- Driver/rider impaired by alcohol (83%)

and the following were described as very likely on fewer than 57% of the occasions on which they were used:

- Sudden braking (57%)
- Road layout (e.g. bend, hill, narrow carriageway) (54%)
- Exceeding the speed limit (54%)
- Travelling too fast for the conditions (54%)
- Fatigue (51%)
- Distraction in vehicle (35%)

Conclusion

The collection of contributory factors has been part of the GB wide police reporting system for 10 years. It is clear that the contributory factor information can provide useful indications of the circumstances that may have led to a reported road accident. These can also be attributed to the different participants within the accident, which can help build a picture of how the accident may have occurred.

However, there are limitations to the system and care should be taken when both analysing and interpreting the results. This should help ensure that the data is used in the correct manner and that consistent messages/results are achieved by users.

We welcome comments on the analysis presented here or any questions regarding the contributory factor system.

Background: The collection of Contributory Factor data

B1. Guidance on recording road accidents is provided in the Department for Transport's *Stats20* document which includes the following points on CFs:

- CFs reflect the reporting officer's opinion at the time of reporting, and may not be the result of extensive investigation;
- subsequent enquiries could result in a change in the reporting officer's opinion;
- the CFs are largely subjective, and depend upon the skill and experience of the investigating officer to reconstruct the events which led directly to the accident;
- the need to exercise judgement when recording CFs is unavoidable;
- CFs should be identified on the basis of evidence from sources such as witness statements and vehicle and site inspections;
- the evidence may be of variable quality, so the officer should record very likely or possible for each CF;
- when there is conflicting evidence (e.g. conflicting witness statements), the reporting officer should decide on the most credible account of the accident and base the codes on this, taking into account all other available evidence.

B2. Some CFs may be less likely than others to be recorded, since clear evidence of them may not be available, or may be very difficult to obtain, after an accident has occurred (e.g. in the case of the nervous, uncertain or panic factor). Participants and witnesses may provide incomplete or conflicting accounts of what happened. The CF data therefore depend upon the skill and experience of the reporting officer to reconstruct the events which led directly to the accident, and so are more subjective in nature than other Stats 19 data. This should be kept in mind when using these results.

B3. Regardless of the number of vehicles that were involved in the accident, *at most six* sets of CF data can be recorded per accident. Each set contains three pieces of information:

- a **factor** which is thought to have contributed to the occurrence of the accident – selected from list of 77, such as:
 - exceeding speed limit (CF code 306);
 - travelling too fast for the conditions (307);
 - failed to look properly (405);
 - impaired by alcohol (501);
 - impaired by drugs (illicit or medicinal) (502)
- the **participant** in the accident to whom the factor is related:
 - whether this is a:
 - Vehicle – in which case the factor may relate to the driver/rider or to the road environment;
 - Casualty – a pedestrian or a passenger in a vehicle; or
 - Uninjured pedestrian.
 - if a Vehicle or a Casualty, the relevant Stats 19 reference
- whether it was thought very **likely** or just **possible** that this factor contributed to the occurrence of the accident

Therefore more than one factor may be recorded for the same participant and any given factor may be recorded for two or more different participants, subject to the limit of a maximum of six sets of CF data per accident.

B4. Appendix B of this publication illustrates the CF codes and their descriptions, including a brief set of completion instructions for the reporting officer. More detailed information is available in the DfT's Stats 20 document (pages 10; 84 -101) and the procedure for allocating them – for example:

- the CFs may be recorded in any order (so nothing can be inferred from the order in which they appear);
- more than one CF may be related to the same road user; and
- the same CF may be related to more than one road user.

Worked example

B5. Clearly, there could be a lot of CF information in the case of an accident which involved several vehicles, if it was thought that several of them contributed to its occurrence. The following is an example of the potential complexity of the CF data. Car 1 is rapidly travelling along a straight road when Car 2 suddenly appears in front of it, having emerged from a pub car park. The driver of Car 1 brakes sharply, to avoid a collision. As Car 2 drives off, Car 1 is hit from behind by a motorcycle, whose rider and passenger are both killed. The following *might* be recorded as the CF data for this accident:

CF no.	Participant	Contributory Factor	How likely?
1	Car 1	Exceeding speed limit	Possible
2	Car 2	Impaired by alcohol	Possible
3	Car 2	Failed to look properly	Very likely
4	Car 1	Sudden braking	Very likely
5	Motorcycle	Following too close	Very likely
6	Motorcycle	Exceeding speed limit	Possible

This accident has *three* participants and *six* CFs, two of which are the *same* (exceeding speed limit) but apply to *different* participants (Car 1 and Motorcycle). This example will be referred to from time to time, when describing some of the CF results.

Quality

B6. As the CFs were added to the Stats 19 data specification at the start of 2005, the results for 2005 could have been affected by teething troubles. In June 2006, the Liaison Group on Road Accident Statistics (LGRAS) discussed a paper on aspects of the quality of the data. It also remains the case the recording of CFs varies between Police Forces. In 2009, there were around 2.1 CFs per accident for Scotland; varying between 1.5 and 2.6 between Forces. In addition, while most Police Forces' CFs are allocated by the reporting officer, in one Force they are allocated by a small team of specialist crash investigators. It may be that a higher degree of accuracy exists for fatal and serious accidents than for slight accidents, as the former may be attended by more experienced road policing officers.

B7. On introduction inconsistencies arose between the CF code and the Type of Participant code (around 3-4% in 2005). The most frequent problem was the combination of the CF code for pedestrian failed to look properly with the Type of Participant code for a Vehicle. In such cases, it wasn't possible to deduce (from the data) which was incorrect. Since then additional quality assurance was introduced leading to an improvement in quality (currently around 1% of cases).

B8. There may be other changes in some of the patterns of the reporting of CFs, as a result of such discussions, the introduction of additional computer cross-checks of the data, Police Forces' increasing experience of the collection and recording of such information, and the use of the data by the Police, local authorities and central government.

Table M: Contributory Factors: Reported accidents^{1,2} by severity, 2015

Contributory factor reported in accident	Fatal		Serious		Slight		All accidents	
	Number	Per cent ³	Number	Per cent ³	Number	Per cent ³	Number	Per cent ³

Total number of vehicles involved	567	100%	688	100%	9,596	100%	307	100%	1,100	100%	166	100%	12,424	100%
Average number of CFs per vehicle	0.65		1.28		1.11		0.73		1.07		1.00		1.08	

1. Includes only accidents where a police officer attended the scene and in which a contributory factor was reported.

2. Excludes invalid codes or pedestrian only factors incorrectly assigned to a vehicle.

3. Vehicles with more than one CF in a category are only counted once in the category total.

Table P: Contributory factors: pedestrians ^{1,2}, 2015

	Number	%
Pedestrian failed to look properly	674	48
Ped. careless / reckless /in a hurry	255	18
Ped. failed to judge vehicles path or sp	193	14
Crossed road masked by stationary/parked	176	12
Pedestrian impaired by alcohol	169	12
Wrong use of pedestrian crossing facility	81	6
Dangerous action in carriageway (eg playing)	75	5
Pedestrian wearing dark clothing at night	71	5
Ped. disability or illness, mental/physical	38	3
Ped. impaired by drugs (illicit/medicinal)	21	1
<hr/>		
Number of Contributory Factors ³	1,753	
Total number of pedestrians involved¹	1,409	
Average number of CFs per pedestrian	1.24	

1. Includes only accidents where a police officer attended the scene and in which a contributory factor was reported.

2. Includes pedestrians injured and non injured in the accident

3. Excludes pedestrians incorrectly attributed a vehicle factor or special code

Table Q: Most common pairs of contributory factors reported together ¹, 2015

Factor with lower code	Factor with higher code	Number
Failed to look properly (D/R)	Failed to judge other pers path/speed (D/R)	669
Poor turn or manoeuvre	Failed to look properly (D/R)	382
Failed to look properly (D/R)	Careless / reckless /in a hurry (D/R)	356
Slippery road (due to weather)	Loss of control	290
Slippery road (due to weather)	Travelling too fast for the conditions	230
Poor turn or manoeuvre	Failed to judge other pers path/speed (D/R)	203
Travelling too fast for the conditions	Loss of control	194
Failed to judge other pers path/speed (D/R)	Careless / reckless /in a hurry (D/R)	182
Pedestrian failed to look properly	Ped. careless / reckless /in a hurry	168
Poor turn or manoeuvre	Careless / reckless /in a hurry (D/R)	160
Loss of control	Careless / reckless /in a hurry (D/R)	154
Pedestrian failed to look properly	Ped. failed to judge vehicles path or sp	138
Crossed road masked by stationary/parked	Pedestrian failed to look properly	128
Following too close	Failed to judge other pers path/speed (D/R)	112
Travelling too fast for the conditions	Careless / reckless /in a hurry (D/R)	104
Poor turn or manoeuvre	Loss of control	102
Swerved	Loss of control	101

1. Includes only accidents where a police officer attended the scene and in which a contributory factor was reported.

NOTE: the basis upon which the combinations are produced is described in the text.

However, an additional example may be helpful.

*Suppose that the "defective brakes" CF has been allocated to participant A,
the "failed to look properly" CF has been allocated to two participants A and B, and
the "failed to judge other person's path/speed" CF has been allocated to participants A, B and C,
The following combinations of CFs would be allocated to the same participant:*

A defective brakes + A failed to look ...

A defective brakes + A failed to judge ...

A failed to look ... + A failed to judge ...

B failed to look ... + B failed to judge ...

Table R: Contributory factors: Casualties in reported accidents - fatalities ¹, 2015

	Person who was killed						as a % of all fatalities
	Pedestrian	pedalcyclist	motorcyclist	Car/taxi user	Other	All

Ped. careless / reckless /in a hurry	1	0	0	0	0	1	1
Pedestrian wearing dark clothing at night	7	0	0	0	0	7	4
Ped. disability or illness, mental/physical	1	0	0	0	0	1	1
Special codes							
Stolen vehicle	0	0	2	0	0	2	1
Vehicle door opened or closed negligently	0	1	0	0	0	1	1
Total Road fatalities	44	5	27	75	15	166	100%

1. Includes only accidents where a police officer attended the scene and in which a contributory factor was reported.

NB: As described in the text, an accident will be counted once for each combination of CF (excluding "repeats") and death. For example, an accident with four different CFs and three deaths would be counted twelve times in this table - each death would be counted against the first CF, then against the second CF, and so on. As a result, the percentages would total far more than 100%. However, "repeats" are excluded: if the same CF applies to two different participants, each death will be counted only once against that CF.

Table S: Contributory factors: Casualties in reported accidents - seriously injured ¹, 2015

Cause of contributory factor - categories in reported accidents - seriously injured, 1999	Person who was seriously injured						as a % of all seriously injured casualties
	Pedestrian	pedalcyclist	motorcyclist	Car/taxi user	Other	All	
Road environment contributed							
Poor or defective road surface	1	1	9	3	0	14	1
Deposit on road (eg oil, mud, chippings)	0	3	16	17	3	39	3

77	Driving too slow for conditions / slow vehicle	2	2	4	0%
All		10,324	5,054	15,379	100%

1. Includes only accidents where a police officer attended the scene and in which a contributory factor was reported.

2. Includes all contributory factors reported, even where the same CF is assigned more than once to an accident (i.e. to more than one participant). Therefore the total differs from earlier tables.

(D/R) indicates Driver/Rider

STATISTICAL TABLES

Reported Road Accidents

Table 1

ACCIDENTS

Population, vehicles licensed, road lengths, traffic on all roads and on M & A roads, reported injury accidents, vehicles involved and casualties: Years: 1953 to 2015

Year	Population	Vehicles licensed ⁽¹⁾	Road lengths	Traffic on all roads	Traffic on M & A roads	Injury accidents	Vehicles involved	Casualties
	Million	Million	Thousand km	Million vehicle km	Million vehicle km	Number	Number	Number
1953	5.100	18,343

1. Traffic estimates are based on an "urban/rural" split which differs slightly from the "built-up/non built-up" classification used for the number of accidents. Therefore, these rates are approximations: the "non-built up" rate is the number of accidents on "non-built up" roads divided by the estimated volume of traffic on "rural" roads, for example. The figures given in this table take account of any revisions to the traffic estimates for previous years.

1. Separate codes for the road surface conditions 'Oil or Diesel' and 'Mud' were used between 1999 and 2004, inclusive. With effect from 2005, 'Oil or diesel' and 'mud' have been recorded under 'Special Conditions at Site'. The accidents for which these codes were used are included in the 'All conditions' figures, but not under any of the categories 'Dry', 'Wet/Damp/Flood' or 'Snow/Frost/Ice', so these changes should have had very little no effect on the time series.

Accident Costs: Details of Calculations

The Department for Transport estimate the values assigned to the cost of road casualties and accidents in Great Britain, for use in cost-benefit analysis of the prevention of road casualties and accidents in road schemes.

The valuation of casualty costs calculated for Great Britain for all levels of severity are based on a willingness to pay human cost approach. This is intended to encompass all aspects of the costs of casualties including both the human cost and the direct economic cost.

Types of Costs

The human cost covers an amount to reflect the pain, grief and suffering to the casualty, relatives and friends, and, for fatal casualties, the intrinsic loss of enjoyment of life over and above the consumption of goods and services. The economic cost covers loss of output due to injury and medical costs.

The cost of an accident also includes:

- the cost of damage to vehicles and property; and
- the cost of police and insurance administration.

A summary of the DfT's latest findings can be found in *Reported Road Casualties GB: 2015*.

<https://www.gov.uk/government/statistics/reported-road-casualties-great-britain-annual-report-2014>

Scotland analysis

The average cost per accident in Scotland and the total cost of all accidents in Scotland are presented in Tables 10 and 11. These are calculated using the GB casualty costs and the number of casualties by severity in accidents in Scotland. The average costs per accident for Great Britain and Scotland differ because of differences in the average numbers of casualties per accident, and the proportions of fatal and serious casualties in an accident.

Also estimated are the number of damage only accidents and their average costs.

Figures are presented in constant 2015 prices. Therefore estimates of values in earlier years have been calculated by applying 2015 values to previous years.

Further information the methodology can be obtained from the DfT:

Table 9

COSTS

(a) Cost per casualty by severity: average costs for Great Britain (£) at 2015 prices

	Killed	Seriously Injured	Slightly Injured	Average all casualties
Average cost per casualty for Great Britain	1,896,543	213,118	16,429	56,656

(b) Costs per accident by element of cost and severity

		Accident Severity			
		Fatal	Serious	Slight	Damage only
Casualty related costs for GB:					
Lost output		706,654	27,953	3,480	
Medical/ambulance		6,278	16,778	1,476	
Pain, grief, suffering		1,388,835	190,460	16,583	
Police and damage to property costs for GB:					
Police/administration		19,973	2,344	605	39
Insurance		348	216	131	62
Damage to property	Total	12,732	5,807	3,431	2,175
	- Motorways	19,565	16,694	8,446	2,945
	- Non built-up roads	15,380	7,012	4,648	3,065
	- Built-up roads	9,068	4,860	2,867	2,050
Total costs per accident for GB		2,134,821	243,559	25,707	2,277

Note: Police costs have been updated following a survey in 2011 of police forces in England, Scotland and Wales.

Table 10

Cost per accident by road type and severity in Scotland (£) for 2015 at 2015 prices

Category of road	Accident Severity			Average for all injury accidents	Damage only	Average for all accidents
	Fatal	Serious	Slight			
Non built-up roads	2,142,185	270,816	27,150	157,680	3,104	20,669
Built-up roads	2,005,008	232,754	23,422	72,863	2,089	5,874
Motorways	2,463,207	265,954	31,608	108,500	2,984	15,253
All roads	2,119,521	248,350	24,952	101,115	2,289	8,835
Trunk roads only	2,210,444	283,354	28,506	147,222	2,814	17,196

2011-15 average	2.69	2.82	0.35	0.88	0.13	0.17	0.36

1. Includes a small number of 'unknown' and 'other' types of vehicles.

2. There may be slight differences between the vehicle types used for road accident statistics and those used for the traffic estimates.

Total	381	731	779	554	921	465	1,010	2,502

1. The distance is estimated using the postcode of the house of the driver or rider, if this is available - please see Annex D.

2. 'Other' includes taxis, minibus, bus or coach, ridden horse, agricultural vehicles and goods vehicles.

3. Due to a small problem with a few records, some of the figures in this table will not match exactly those of other tables.

4. Fife, Lothian & Borders and Tayside do not collect data for foreign drivers.

5. Due to a problem with the methodology in producing this table, there was an error in with these figures in previous editions of this table.

Table 16 cont'd

Total	1,672	1,947	715	750	640	1,600	14,667

1. The distance is estimated using the postcode of the house of the driver or rider, if this is available - please see Annex D.

2. 'Other' includes taxis, minibus, bus or coach, ridden horse, agricultural vehicles and goods vehicles.

3. Due to a small problem with a few records, some of the figures in this table will not match exactly those of other tables.

4. Fife, Lothian & Borders and Tayside do not collect data for foreign drivers.

5. Due to a problem with the methodology in producing this table, there was an error in with these figures in previous editions of this table.

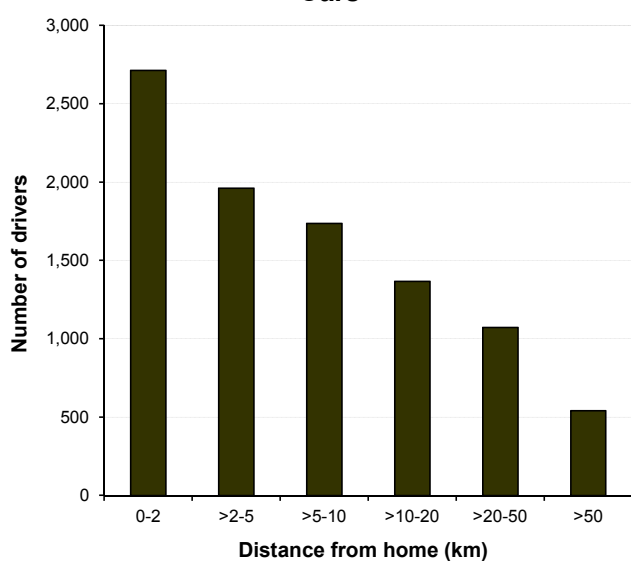

Estimated distance between the home of the driver or rider and the location of the reported injury accident by type of vehicle: Scottish residents only
excluding cases for which the distance cannot be estimated

Year: 2015

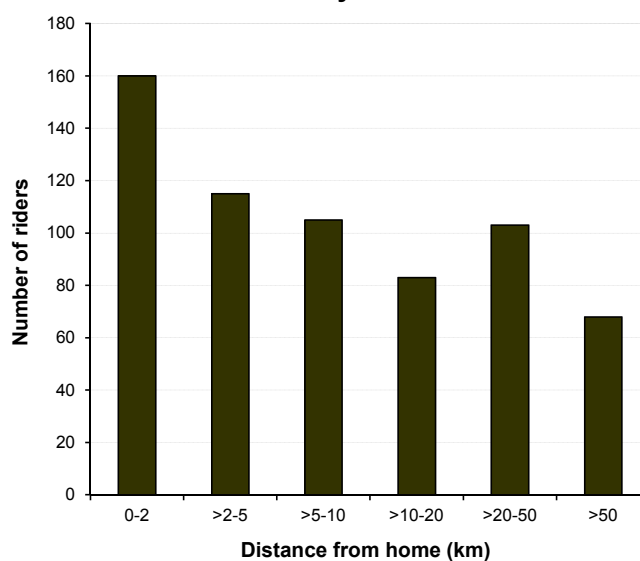

All vehicles

Cars

Motor cycles

Pedal cycles

Other vehicles

1. In some cases, a driver's age and/or sex was not known. Such drivers are counted in the table on the basis of whatever details are known - i.e. in the appropriate age-groups if their ages are known, and in the appropriate sex category if their sex is known. The 'all ages' totals include those whose ages were not traced, and the 'both sexes' totals include those of unknown sex. The grand totals include those for whom neither the age nor the sex was known, most of whom will be the drivers of cars which were parked at the time of the accident.

2. Including drivers whose age is not known.

3. Excludes drivers under 17 and those where ages and sex are not known.

4. Including drivers whose age is not known.

Table 18

CAR DRIVERS

Car drivers involved in reported injury accidents by age and sex
Years: 2005 to 2015

(a) 17-25

Rate per thousand population

**(b) 26-34**

Rate per thousand population

**(c) 35-59**

Rate per thousand population

**(d) 60+**

Rate per thousand population

**(e) Male**

Rate per thousand population

**(f) Female**

Rate per thousand population

1. From 2013 "other motor vehicles" and "other non-motor vehicles" categories have been combined on the data collection forms. This means that there are a very small number of non-motor vehicle drivers included in the table. Other changes to historic data for example new information provided by police will also result in differences in the historic data compared to previous publications.

Motorists involved in reported injury road accidents with positive or refused breath test
Years: 2004 to 2015

(a) Late afternoon/evening to night time (3pm-3am)

(b) Early morning to early afternoon (3am-3pm)

Table 22

(a) Estimated number of reported drink drive *accidents*

Years: 2004 to 2014

(b) Estimated number of reported drink drive *casualties*

Years: 2004 to 2014

Drink-drive accidents and casualties

Drink-drive estimates: background

1. The Department for Transport (DfT) annually estimates the number of reported drink drive accidents: i.e. those reported injury road accidents involving drivers with illegal alcohol levels (above the current drink-drive limit of 80 milligrams (mg) of alcohol per 100 millilitres (ml) of blood or 35 micrograms per 100ml of breath in England and Wales or 50 milligrams (mg) of alcohol per 100 millilitres (ml) of blood or 22 micrograms per 100ml of breath in Scotland from 05/12/2014). DfT published GB estimates in [Reported road casualties in Great Britain: Estimates for accidents involving illegal alcohol levels: 2014 \(final\) and 2015 \(provisional\)](#) in August 2016. Scotland estimates are presented in Table ras51019 and will be updated with 2015 data in September 2017. Because of the uncertainty involved figures are rounded to the nearest ten.

<https://www.gov.uk/government/statistical-data-sets/ras51-reported-drinking-and-driving>

2. The DfT's publication outlines the estimation methods in detail. It draws on Stats 19 reported road accident data (where motor vehicle drivers or riders failed or refused to provide a sample of breath) and Procurators Fiscal (and Coroners in England and Wales) data on blood alcohol levels of drivers who died within 12 hours of being injured in a road accident. The estimates include allowances for the numbers of cases where drivers or riders are not breath tested due to the accident being a hit and run accident. Drink drive casualties are defined here as any casualties resulting from a drink drive accident.

3. Estimates for 2015 are not yet available because of the timing of the provision of the data regarding blood alcohol levels of fatalities from Procurators Fiscal (and Coroners in England and Wales) to DfT. At this stage the sample of 2015 data is insufficient to allow a breakdown by country.

4. There are no estimates for Scotland of the number of alcohol-related injury road accidents which involve *legal* alcohol levels (i.e. alcohol levels up to and including the current drink-drive limit of 80mg of alcohol per 100ml of blood), nor are there any estimates for Scotland of the numbers of *non-injury* (damage only) road accidents involving illegal alcohol levels.

5. The figures here differ from the number of drivers with positive (or refused) breath tests. While the Police aim to breath test all drivers involved in an accident this isn't always possible (e.g. hit and run drivers or due to severity of casualty). Recently, just under two thirds of motorists involved in injury road accidents in Scotland have been breath tested.

Table 22 Estimated number of reported drink drive accidents and casualties, 2004 to 2014

	Number of accidents/casualties

Appendices

Local Authorities & Police Divisions 2013

Local Authorities and Police Boundaries, 2008 - 2012

Appendix A – Calendar of events affecting road traffic

- 1964-65:** Road Traffic Act 1964 – Wider powers for speed limits. Trial 70 mph speed limit on motorway and other previously de-restricted roads. 50 mph speed limit on selected roads during summer.
- 1967:** Seat belts compulsory on new cars – Permanent 70 mph speed limit on all roads. An offence to drink and attempt to drive with over 80 mg of alcohol per 100 ml of blood.
- 1968-69:** Transport Act 1968 allowed regulations on length of drivers' working hours – 3 year old vehicles need test certificate.
- 1970:** New regulations on lorry and PSV drivers' hours of work.
- 1973:** Reorganisation of local government in Scotland, 9 regions and 3 islands areas and 53 districts.
- 1973-74:** Safety helmets compulsory for 2-wheeled motor vehicle users – 50 mph national maximum speed limit, later motorway 70 mph, dual carriageway 60 mph – Vehicle lighting regulations.
- 1974:** Road traffic act 1974 placed a duty on authorities to study road accidents and take measures to prevent them.
- 1975:** Temporary 50 and 60 mph limits extended.
- 1976:** Licensing Scotland Act 1976 – extension of licensing hours until 11pm – effective from 13 December 1976.
- 1977:** 50 and 60 mph limits raised to 60 and 70 mph.
- 1977:** Licensing Scotland Act 1976 – extension of Sunday opening – effective from October 1977.
- 1978:** 60 and 70 mph limits permanent – New rules on maximum hours which may be worked by goods vehicle drivers.
- 1982:** New 2-part motorcycle test from 29 March – Application of 2 year limit on provisional motorcycle licence took effect from 1 October.
- 1983:** Transport Act 1981 introduced evidential breath testing and made seat belt wearing law for drivers and front seat passengers of most cars and light vans. Learner motorcyclists now only allowed to ride machines of up to 125 cc.
- 1984:** Regulations introduced requiring spray reducing devices to be fitted to lorries and trailers.
- 1985:** In December, Scottish Police Authorities introduced a policy of breath testing all drivers in an accident wherever possible.
- 1986:** Deregulation of buses from 26 October 1986 as a result of the Transport Act 1985.
- 1986:** All new cars manufactured from 1 October to be fitted with rear seat belts. Seat belt legislation made permanent. European Road Safety Year.
- 1987:** Legal requirement introduced requiring all newly registered cars to be fitted with rear seat belts or child restraints from 1 April. Government sets a target to achieve a one-third reduction in road accident casualties by the year 2000.
- 1988:** All coaches first used from 1 April 1974 using a motorway must have 70 mph limiters fitted by 1 April 1991.
- 1989:** Penalty points increased for careless driving, driving without insurance and failing to stop after or to report an accident. Seat belt wearing by rear child passengers became law in cars where appropriate restraints have been fitted and are available. Accompanied motorcycle testing became mandatory.
- 1990:** Compulsory basic training for motorcyclists introduced and learner drivers banned from carrying pillion passengers. High Risk Offenders Scheme for problem drink-drivers extended.

New regulations requiring those accompanying learner drivers to be at least 21 years old and to have held a licence for 3 years. Scottish Road Safety Year.

- 1991:** Seat belt wearing by rear adult passengers became law in cars where belts are fitted and available. New road hump regulations introduced to reduce traffic speed.
- 1992:** Subsequent to the Road Traffic Act 1991, new road traffic offences and penalties came into force, including retesting of dangerous drivers. The Traffic Calming Act 1992 came into force enabling roads authorities to introduce a wide range of traffic calming measures. Requirement for minimum tread depth of 1.6 mm introduced for cars and light vans. All new goods vehicles over 7.5 tonnes fitted with 60 mph speed limiters.
- 1993:** First speed enforcement cameras introduced in Scotland. The MOT test extended, including new checks on mirrors, windscreen condition, fuel tanks, seat and door security and number plates.
- 1994:** First 20 mph zones introduced in Scotland. Traffic Calming (Scotland) Regulations came into force.
- 1995:** Pass Plus scheme introduced for new drivers which encourages new drivers to take more lessons by offering discount on motor insurance.
- 1996:** Local Government etc. (Scotland) Act 1994 implemented with the creation of 32 unitary authorities replacing the previous regions and districts.
- 1996:** Driving theory test introduced from 1 July for car and motorcycle learners. Road Traffic (New Drivers) Act 1996 – requires newly qualified drivers to retake the driving test if they acquire 6 or more penalty points within 2 years of passing their test – effective from 1 June 1997. Requirement for coaches and minibuses to be fitted with seat belts when carrying children on organised trips, including journeys between home and school – effective from February, 1997. End of concession, where seat belts are fitted, whereby 3 children could share a double seat.
- 1997:** New Zebra, Pelican and Puffin crossing regulations introduced, with Puffin crossings prescribed for the first time.
- 1998:** New Road Humps regulations came into force giving local authorities wider powers to establish road humps.
- 1999:** Amendment to the Road Traffic Regulation Act 1984 gave local authorities power to introduce traffic calmed 20 mph zones and 20 mph speed limits, with or without traffic calming measures, at suitable locations. Revised Highway Code published.
- 2000:** The Government announced a new road safety strategy and casualty reduction targets for the period to 2010 in “*Tomorrow’s Roads – Safer for Everyone*”. A review of speed policy was conducted and reported in ‘*New Directions in Speed Management*’.
- 2001:** Amendment to the Road Traffic Regulation Act 1984 made it clear that school crossing patrols can stop traffic for children of all ages and adults and gave local authorities greater flexibility in the times that school crossing patrols can operate. Scottish Executive awarded nearly £15 million to local authorities for cycling, walking and safer streets projects, including safer routes to school schemes.
- 2002:** New Home Zones (Scotland) Regulations came into force. These set out the procedures local authorities must follow when designating home zones.
- 2003:** Revised guidance on school transport issued to local authorities. Scottish School Travel Advisory Group report published. Scottish Executive provided the funding to implement the report’s key recommendation to create school travel co-ordinator posts within each Scottish local authority.
- 2004:** Publication of the first three year review of the GB road safety strategy and casualty reduction targets, set out in “*Tomorrow’s Roads – Safer for Everyone*”.

- 2006:** Road Safety Act passed. The Act made provision for a wide range of road safety matters, including drink driving, speeding, driver training and driver and vehicle licensing. Revised guidance on setting local speed limits issued to local authorities.
- 2007:** Publication of the second three year review of the GB road safety strategy and casualty reduction targets, set out in “*Tomorrow’s Roads – Safer for Everyone*”. Publication of DfT Child Road Safety Strategy, which included measures by the Scottish Government to reduce child road casualties.
- 2008:** GB consultation – *Learning to Drive* – published, on changes to the driver training and testing regime. GB consultation on *Road Safety Compliance*, covering speeding, drink driving, seat belts, drug driving and careless driving, published.
- 2009:** Scotland’s Road Safety Framework to 2020 published. The Framework sets Scottish specific targets for casualty reductions in the period to 2020, in line with an aspirational vision of a future where no-one is killed on Scotland’s roads and the injury rate is greatly reduced.
- 2009/2010:** ACPOS launched a Vehicle Forfeiture Scheme for Drink Drivers.
- 2010:** Have You Clicked? Year long campaign launched on 19 April.
- 2010:** 25 years of Road Safety Scotland. 2010 marks the 25th anniversary of Road Safety Scotland (RSS), previously operating as the Scottish Road Safety Campaign (SRSC)
- 2011:** Launch of the United Nations Decade of Action for Road Safety 2011-2020.
- 2011:** Publication of National Debate on Young Drivers’ Safety presenting the findings of a national debate on young driver issues undertaken across Scotland.
- 2011:** Publication of the New Strategic Framework for Road Safety by the UK Government.
- 2012:** Devolution of powers to the Scottish Parliament in relation to the Drink-Drive alcohol blood limit, and certain national speed limits
- 2013:** UK Government introduced changes for drivers guilty of offences such as tailgating or middle-lane hogging with fixed penalty notices of a £100 fine and three penalty points being issued. Existing fixed penalty fines for most driving offences, including mobile phone use and not wearing a seat belt rise from £60 to £100.
- 2013:** Publication of a review of the Guide to Improving School Transport and its accompanying report were issued to all local authorities in Scotland.
- 2014:** Transport Minister, Keith Brown, announced plans to legislate in the next Scottish Parliament to ensure that seatbelts are provided on all dedicated school transport in Scotland.
- 2014:** Following consultation that showed overwhelming support, Ministers reduced the drink drive limit from 80 mg per 100 ml of blood to 50 mg per 100 ml
- 2014:** The A9 average speed camera system went live on 28 October alongside an increase in the HGV speed limit on the single carriageway sections between Perth and Inverness.
- 2015:** Publication of “Good Practice Guide on 20 mph Speed Restrictions”
- 2015:** Scottish Road Safety Week pilot undertaken.
- 2015:** British Road Safety Statement published by the UK Government.
- 2016:** The output of the Mid-term Review of *Scotland’s Road Safety Framework* is published.
- 2016:** An updated *Strategic Road Safety Plan* for the trunk road network is published
- 2016:** Power speed limits, traffic signs and parking are devolved to the Scottish Parliament through the 2016 Scotland Act.

Appendix B

The collection of road accident statistics, and examples of forms that could be used to collect the data

1. Introduction

This Appendix describes briefly the arrangements for collecting road accident statistics. It then provides examples of paper forms that could be used to collect the data.

2. The collection of road accident statistics

The Road Accident statistics are compiled from returns made by police forces. For each injury road accident known to have occurred in their areas, the police authorities complete a statistical return (named **Stats 19**), which provides details of the accident circumstances, separate information for each vehicle which was involved in the accident, and separate information for each person who was injured in the accident. Examples of the forms appear later and show details collected with effect from 2005, following the implementation of the changes recommended in the 2002 Quality Review (see Appendix C).

The statistical returns cover all accidents in which a vehicle is involved that occur on roads (including footways) and result in death or personal injury, *if they become known to the police*. It should be noted that the vehicle need not be moving, and need not be in collision – for example, the returns include accidents involving people alighting from buses. Road accidents in which no-one is injured (damage only accidents) are *not* covered by this definition, so the Transport Scotland (TS) does not receive details of such accidents, and this publication cannot give any figures for them.

Full guidance on the completion of the Stats 19 statistical returns, including detailed notes and definitions of the coverage of the returns and of the information to be provided in each field, is given in a document produced by the Department for Transport (DfT), called *Instructions for the Completion of Road Accident Reports* (which is also referred to as the **Stats 20**).

The returns for accidents in Scotland are submitted to TS every month by the police authorities, either directly or with the assistance of a local Council. All the returns should first be subject to the validity and consistency checks specified in a document called *Procedures for Submitting Road Accident Data to The Scottish Executive*. (also known as the Scottish Edition of **Stats 21**). TS also applies these checks, and clears any errors that it finds with the police. The returns are added to the TS Transport Statistics branch's database, which contains statistical information about all injury road accidents in Scotland since 1979.

The Transport Statistics branch's records for accidents which occurred on Motorways and A roads are copied to the Trunk Road Network Management Directorate of Transport Scotland, which maintains a database of information about trunk roads. From all the Motorway and A road accidents, the ones which occurred on trunk roads are identified using their road numbers and their grid co-ordinates, and the information about them added onto the Trunk Road Network Management Directorate database. The TS is subsequently informed which of these accidents occurred on trunk roads, and its database is updated accordingly.

Similar returns are made throughout Great Britain. TS sends a copy of the Scottish data to DfT, which holds a database of accident records for the whole of Great Britain.

Copies of the Stats 19 illustrative forms (see below) the Stats 20 and Stats 21 documents, a detailed list of all changes made at the start of 2005, and other documentation are available from the TS Transport Statistics Web site: see Data Sources and Methodology at: <http://www.transportscotland.gov.uk/analysis/statistics/about/data-sources/road-accidents>

A further review of the Stats 19 system took place in 2008. More changes were made to the collection of the data which took effect from 2013. A summary of the changes made by SCRAS can be found here

http://www.transport.gov.scot/system/files/uploaded_content/documents/research/DfT_2008_review_of_STATS_19.pdf

3. Examples of forms that could be used to collect the road accident statistics data

This Appendix provides examples of paper forms that could have been used to collect the data for the road accident statistics returns. Two types of form are shown:

- a. the illustrative Stats 19 form – this shows only the information which is now collected for national statistical purposes;
- b. an example of a more sophisticated form, which was developed by Middlesex University – this shows both the information needed for national statistical purposes and examples of the kinds of other details which may be obtained for local use.

In both cases, separate pages are used for information about the Attendant Circumstances, the Vehicles involved and the Casualties. For example, the illustrative Stats 19 form has a separate page for each Vehicle and a separate page for each Casualty. The Middlesex University form can hold details of two Casualties on one page, and details of two Vehicles (side by side) spread over two pages. What is sometimes referred to as an accident book would contain a number of such pages (when an accident involves more vehicles or more casualties than the book allows for, the officer can attach extra pages for the other vehicles and casualties). The Middlesex University form's pages differ in size, so that one can turn quickly to a particular page of the accident book.

In practice, each Police Force uses its own system, which may not involve the use of paper forms. For example, details of an accident may be recorded on a Personal Digital Assistant by an officer at the scene, or the information may be keyed into a computer by the officer or by the clerical staff whom the officer telephones to report the accident. However, some police forces have recorded the information required for statistical purposes using forms which were, for example:

- a. based on the illustrative Stats 19, with slight modifications to include boxes to collect additional information for local use, such as codes for the reporting officer, the Police beat on which the accident occurred, and the school attended (if a casualty was a school pupil en route to or from school); or
- b. in effect, a data preparation coding form with (e.g.) boxes for all the statistical information about the Attendant Circumstances, up to three Vehicles and up to four Casualties, *and* some information for local use, all on *one* double-sided A4 sheet. Anyone completing such a form would have to refer to a separate document for details of the codes for variables such as Road Class, Type of Vehicle and Pedestrian Location. As well as such forms, the Police Force would, of course, hold other information about the accident (for example, in the officer's notebook, reports and administrative records).

4. The illustrative Stats 19 form (2013 onwards)

The first four pages of forms in this Appendix together make up the illustrative Stats 19 form. As mentioned, this shows only the information that is collected for the national road accident statistics. With the exception of the Contributory Factors, the forms show each variable's reference number (e.g. 1.7 for the Date on the Attendant Circumstance form; 2.5 for the Type of Vehicle on the Vehicle form), which identifies the relevant section in the Stats 20 *Instructions for the Completion of the Road Accident Reports*. A new version of the form is produced following recommendations of each Quality Review.

The recommendations from the latest review in 2008 has been implemented from January 2013. A revised illustrative STATS 19 form and the accompanying STATS 20 and STATS 21 guidance can be found here

<http://www.transportscotland.gov.uk/analysis/statistics/about/data-sources/road-accidents>

5. The Middlesex University form (based on the 1999-2004 Stats 19 specification)

The form shown on the remaining pages of this Appendix was developed by Middlesex University, as part of a research project *The Development of Improved Methods for Representing Road Accident Data*, funded by the Engineering and Physical Sciences Research Council. The research objectives included:

- a. to define the accident attributes required for the more effective diagnosis and design of accident remedial schemes and to integrate these with the data required for the compilation of national accident statistics;
- b. to investigate methods of data collection and to design a police accident report form which includes the required attributes and reflects an intuitive perception of the causes of particular accidents.

The researchers surveyed Police Forces, explored their methods of data collection, assessed the kinds of forms used, identified a number of deficiencies in their design, and developed the form which appears here. This was used on a small-scale trial basis by some officers in eight Police Forces: many found the form easy to complete once they were familiar with it. The researchers concluded that it would be difficult to produce a single form that satisfied the requirements of each police force, but forms based on sound principles of graphic design would be easier to complete and less prone to errors.

The researchers also considered an electronic version of the form for the internet, designed to be independent of platform, relatively easy to produce, and to include data validation and help menus.

The Middlesex University form is based on the Stats 19 specification that applied from 1999 to 2004, therefore does not take account of changes made with from 2005. The form also shows the kinds of information that may be collected for local use (e.g. boxes for the officer to tick to indicate whether the driving licence, insurance certificate are in order).

We are grateful to the researchers for permission to reproduce the form. For further information please contact:

What Factors Contributed To The Accident?

Select **up to six** Factors from the grid, relevant to the accident

Factors may be shown in any order, but an indication must be given of whether each Factor is **very likely** (A) or **possible** (B).

Only include factors which have contributed to the accident. (I.e. do NOT include "Poor road surface" unless it was relevant to the accident)

The same factor may be related to more than one road user, if appropriate.

The participant should be identified by the STATS19 vehicle or casualty reference number, preceded by "V" if factor applies to a vehicle, driver/rider or the road environment (eg V002), or "C" for a pedestrian or passenger casualty (eg C001). Enter "U000" if an uninjured pedestrian contributed

	1st	2nd	3rd	4th	5th	6th
Factor in the accident						
Which participant? (eg V001, C001, U000)						
Very likely (A) or possible (B)						

Road Environment Contributed	Vehicle Defects	Driver/Rider Only (Includes Pedal Cyclists and Horse Riders)					Pedestrian Only (Casualty or Uninjured)	Special Codes
		Injudicious Action	Driver/Rider Error or Reaction	Impairment or Distraction	Behaviour or Inexperience	Vision Affected by		
Poor or defective road surface [101]	Tyres illegal, defective or under inflated [201]	Disobeyed automatic traffic signal [301]	Junction overshoot [401]	Impaired by alcohol [501]	Aggressive driving [601]	Stationary or parked vehicle(s) [701]	Crossed road masked by stationary or parked vehicle [801]	Stolen vehicle [901]
Deposit on road (eg. oil, mud, chippings) [102]	Defective lights or indicators [202]	Disobeyed Give Way or Stop sign or markings [302]	Junction restart [402]	Impaired by drugs (illicit or medicinal) [502]	Careless/Reckless/In a hurry [602]	Vegetation [702]	Failed to look properly [802]	Vehicle in course of crime [902]
Slippery road (due to weather) [103]	Defective brakes [203]	Disobeyed double white line [303]	Poor turn or manoeuvre [403]	Fatigue [503]	Nervous/Uncertain/Panic [603]	Road layout (eg. bend, winding road, hill crest) [703]	Failed to judge vehicle's path or speed [803]	Emergency vehicle on call [903]
Inadequate/Masked signs or road markings [104]	Defective steering or suspension [204]	Disobeyed pedestrian crossing facility [304]	Failed to signal/ Misleading signal [404]	Uncorrected, defective eyesight [504]	Driving too slow for conditions or slow veh (eg tractor) [604]	Buildings, road signs, street furniture [704]	Wrong use of pedestrian crossing facility [804]	Vehicle door opened or closed negligently [904]
Defective traffic signals [105]	Defective or missing mirrors [205]	Illegal turn or direction of travel [305]	Failed to look properly [405]	Illness or disability, mental or physical [505]	Inexperienced or learner driver/rider [605]	Dazzling headlights [705]	Dangerous action in carriageway (eg playing) [805]	
Traffic calming (eg speed cushions, road humps, chicanes) [106]	Overloaded or poorly loaded vehicle or trailer [206]	Exceeding speed limit [306]	Failed to judge other person's path or speed [406]	Not displaying lights at night or in poor visibility [506]	Inexperience of driving on the left [606]	Dazzling sun [706]	Impaired by alcohol [806]	
Temporary road layout (eg contraflow) [107]		Travelling too fast for conditions [307]	Too close to cyclist, horse or pedestrian [407]	Rider wearing dark clothing at night [507]	Inexperience with type of vehicle [607]	Rain, sleet, snow, or fog [707]	Impaired by drugs (illicit or medicinal) [807]	
Road layout (eg bend, hill, narrow carriageway) [108]		Following too close [308]	Sudden braking [408]	Driver using mobile phone [508]		Spray from other vehicles [708]	Careless/Reckless/In a hurry [808]	
Animal or object in carriageway [109]		Vehicle travelling along pavement [309]	Swerved [409]	Distraction in vehicle [509]		Visor or windscreen dirty or scratched or frosted etc [709]	Pedestrian wearing dark clothing at night [809]	
Sunken, raised road marking or slippery inspection cover [110]		Cyclist entering road from pavement [310]	Loss of control [410]	Distraction outside vehicle [510]		Vehicle blind spot [710]	Disability or illness, mental or physical [810]	Other – Please specify below [999]

---	---	---	--	---	--	---	--------------------------------

Vehicle Location at First Impact

On Restricted lane – away from main c'way

On Road

☐ Leaving the main road (1)
☐ Entering the main road (2)
☐ On the main road (3)
☐ On the minor road (4)

☐ Tram/light rail track (6)
☐ Bus lane (7)
☐ Busway (including guided bus way) (8)
☐ Cycle lane (on main c'way) (9)
☐ Cycleway (separated from main c'way) (10)
☐ On lay-by or hard shoulder (11)
☐ Entering lay-by or hard shoulder (12)
☐ Leaving lay-by or hard shoulder (13)
☐ Footway (pavement) (14)

Junction Location of Vehicle at First Impact

☐ Not at junction (or within 20 metres) (0)
☐ Vehicle approaching junction or parked at junction approach (1)
☐ Vehicle in middle of junction (2)
☐ Vehicle cleared junction or parked at junction exit (3)
☐ Did not impact (4)

Skidding and Jack-knifing

☐ No skidding, jack-knifing (0)
☐ Skidded (1)
☐ Jack-knifed (3)

Did the vehicle Overturn?

☐ Yes (1)
☐ No (2)

Hit Object In Carriageway

☐ None (0)
☐ Previous Accident (1)
☐ Road works (2)
☐ Parked vehicle
☐ Bridge
☐ Bollard / Refuge (7)
☐ Open door of vehicle (8)
☐ Central island of roundabout (9)
☐ Kerb (10)
☐ Other object (11)

☐ lit (3)
☐ unlit (4)
☐ side (6)
☐ roof (5)

Vehicle Leaving Carriageway

☐ Did not leave c'way (0)
☐ Left c'way nearside (1)
☐ Left c'way straight ahead at junction (3)
☐ Left c'way offside

Did the vehicle rebound?

☐ Yes (1)
☐ No (2)

☐ onto central reservation (4)
☐ crossed central reservation (6)
☐ none of the above (7)

First Point of Impact

☐ Did not impact (0)
☐ Front (1)
☐ Back (2)
☐ Offside (3)
☐ Nearside (4)

Hit Object Off Carriageway

☐ None (0)
☐ Road sign / Traffic signal (1)
☐ Lamp post (2)
☐ Telegraph pole / Electricity pole (3)
☐ Tree (4)
☐ Bus stop / Bus shelter (5)
☐ Central crash barrier (6)
☐ Nearside or offside crash barrier (7)
☐ Submerged in water (completely) (8)
☐ Entered ditch (9)
☐ Other permanent object (10)

Breath Test

☐ Not applicable (0)
☐ Positive (1)
☐ Negative (2)
☐ Not requested (3)
☐ Refused to provide (4)
☐ Driver not contacted at time (5)
☐ Doctor refused permission (6)

☐ Unclassified (6)

1st Road No.:

Speed Limit of 1st Road:

Road Type

- ☐ Roundabout (1)
☐ One way street (2)
☐ Dual Carriageway
☐ Single carriageway
☐ Unknown (9)

- ☐ 2 lanes (3)
☐ 3 or more lanes (4)

- ☐ single track road (5)
☐ 2 lanes-two way capacity (6)
☐ 3 lanes-two way capacity (7)
☐ 4 or more lanes-two way capacity (8)

Pedestrian Crossing

- ☐ No crossing facility within 50 metres (0)
☐ Crossing facility available

Human Control

- ☐ Controlled by school crossing patrol (1)
☐ Controlled by other authorised person (2)

Physical Facilities

- ☐ Zebra Crossing (3)
☐ Pelican, puffin, toucan or similar non-junction pedestrian light crossing (4)
☐ Pedestrian phase at traffic signal junction (5)
☐ Central Refuge-no other controls (6)
☐ Footbridge or subway (7)

☐ Not at or within 20m of junction (0)

Junction Detail

- ☐ Roundabout (1)
☐ Mini roundabout (2)
☐ T or staggered junction (3)
☐ Slip road (5)
☐ Crossroads (6)
☐ Multiple junction (7)
☐ Using private drive or entrance (8)
☐ Other junction (9)

Junction Control

- ☐ Authorised person (1)
☐ Automatic traffic signal (2)
☐ Stop sign (3)
☐ Give way sign or markings (4)
☐ Uncontrolled (5)

2nd Road Class

- ☐ Motorway (1)
☐ A (M) (2)
☐ A (3)
☐ B (4)
☐ C (5)
☐ Unclassified (6)

2nd Road Number

Weather Conditions

- ☐ Fine (1)
☐ Raining (2)
☐ Snowing (3)
☐ Fog or mist-if hazard (4)
☐ Other (5)
☐ Unknown (6)

Road Surface

- ☐ Dry (1)
☐ Wet/Damp (2)
☐ Snow (3)
☐ Frost/Ice (4)
☐ Flood (5)
(surface over 3cm)
☐ Oil or diesel (6)
☐ Mud (7)

Light Conditions

- ☐ Daylight (1)
☐ Darkness (2)

Street Lighting

- ☐ present (3)
☐ not present (4)
☐ unknown (5)

- ☐ lit (6)
☐ unlit (7)

Special Conditions at Site

- ☐ None (0)
☐ Automatic traffic signal out (1)
☐ Automatic traffic signal partially defective (2)
☐ Permanent road signing defective or obscured (3)
☐ Road works present (4)
☐ Road surface defective (5)

Carriageway Hazards

- ☐ None (0)
☐ Dislodged vehicle load in c'way (1)
☐ Other object in c'way (2)
☐ Involvement with previous accident (3)
☐ Dog in c'way (4)
☐ Other animal or pedestrian in c'way (5)

Were there high winds?

- ☐ Yes (1) ☐ No (2)

Attendant Circumstances

Accident Causation Factors

- ☐ Vehicle
☐ Casualty

Ref. No.

What went wrong?

Tick (✓) only one.

Failure of Driver / Rider

Failure of Pedestrian/Passenger

- ☐ Pedestrian entered c'way without due care (driver/rider not to blame) (7)
☐ Passenger fell in or near PSV (8)

Perception

- ☐ Failed to stop (mandatory sign) (1)
☐ Failed to give way (2)
☐ Failed to avoid pedestrian (pedestrian not to blame) (3)
☐ Failed to avoid vehicle / object in c'way (4)
☐ Failure to signal / misleading signal (5)
☐ Loss of control of vehicle (6)

OR

Manoeuvres

- ☐ Swerved to avoid object in c'way (9)
☐ Sudden braking (10)
☐ Poor turn / manoeuvre (11)
☐ Poor overtaking (12)
☐ Drove wrong way (e.g. one-way street) (13)
☐ Opening door carelessly (14)
☐ Other (please supply details) (15)

Why?

Choose up to four Causation Factors and indicate them in order of importance (1, 2, 3, or 4).

Show confidence in the codes by deleting as appropriate:
A=Definite, B=Probable or C=Possible

-A/B/C Person impaired by alcohol (1)

.....A/B/C Obscuration of view due to glare from sun (46)
.....A/B/C Obscuration of view due to glare from headlights (47)
.....A/B/C Obscuration due to bend/winding road (48)
.....A/B/C Obscuration due to stationary/parked vehicle (49)
.....A/B/C Obscuration due to moving vehicle (50)
.....A/B/C Obscuration due to buildings, fences, vegetation, etc. (51)
.....A/B/C Obscuration due to Weather (e.g. mist or sleet) (52)
.....A/B/C Failed to see pedestrian or vehicle in blindspot (53)
.....A/B/C Animal out of control (54)

Details of any OTHER factors:

Reporting Officers Submissions

The O.I.C. must indicate the actions that C.J.O. should complete:

- ☐ Send N.I.P. Vehicle No.:
☐ Send 1216 Vehicle No.:
☐ DQI Drivers:
☐ VQI Vehicle No.:
☐ Obtain Statements/ Send Questionnaires
☐ Other (specify):

Tick if included:

- ☐ Proforma Statement
☐ Witness Statements
☐ Sketch Plan Copy of PNB
☐ Contemp Notes
☐ Other (specify):

Reporting Officer

Name:
Signature:
Force No.:

Area Supervisor's Decision

Comments:

Tick if included:

- ☐ Registration & Return to O.I.C.
☐ To C.J.O. for: ☐ Prosecution
☐ Caution - Letter
☐ NFA - Letter
☐ Obtain further evidence

Supervisor

Appendix C

Consultation & reviews

1. Introduction

This Appendix describes the arrangements for consulting users and providers of the road accident statistics. It also discusses the regular reviews of the Stats 19 road accident statistics specification, describing the changes to the Stats 19 specification in 2005 and the future recommendations resulting from the recent (2008) review.

2. The Liaison Group on Road Accident Statistics (LGRAS)

Transport Scotland (TS) consults the Liaison Group on Road Accident Statistics (LGRAS), whose members include representatives of each Police Force and of the Association of Chief Police Officers (Scotland), of some individual local authorities and of the Society of Chief Officers of Transportation in Scotland, and of other types of user of the statistics, including the Royal Society for the Prevention of Accidents, the Institute of Road Safety Officers in Scotland, a transport consultant, and an academic researcher. LGRAS meets, on average, once a year. It discusses matters such as the arrangements for the supply of the road accident statistics data, the quality of the information collected and implications of using the data for certain purposes, the likely availability of other information, proposals for changes to the Stats 19 road accident statistics specification, and improvements.

Further details of LGRAS (including papers and minutes) are available at:
<http://www.transportscotland.gov.uk/analysis/statistics/scotstat/committees>

3. The Standing Committee on Road Accident Statistics (SCRAS)

Users and providers of reported road accident statistics across Great Britain are consulted via the Standing Committee on Road Accident Statistics (SCRAS), chaired by the Department for Transport (DfT). Its members include representatives of the Association of Chief Police Officers (Scotland), COSLA, TS, and other interested parties from across Great Britain. SCRAS is responsible for reviewing the GB-wide Stats 19 road accident statistics specification (see below) and discusses other aspects of the collection and use of the road accident statistics.

Further information is available from Anil Bhagat at the DfT (Tel: 020 7944 3078) or
<http://tinyurl.com/pqjh3ez>.

4. Reviews of the Stats 19 road accident statistics specification

National & local government police forces across Great Britain work closely to achieve an agreed standard for the system for collecting & processing statistics on road accidents involving personal injury. The statistics are subject to regular reviews (led by SCRAS) as part of the continued drive to improve quality and meet user needs whilst minimising the burden of collection. The results of the recent review, including results of the public consultation were published by the DfT on 5 August 2010. The review made a number of recommendations for change to the process, coverage and definition of the Stats 19 collection system which was implemented in 2013. Details can be found at:
<http://webarchive.nationalarchives.gov.uk/20110503151558/http://dft.gov.uk/pgr/statistics/committeesusergroups/scras/2008reviewstats19/>

The review process

Scoping papers and questionnaires are published on the DfT's website and users and providers of road accident statistics across Great Britain are invited to provide their views and to suggest other possible improvements.

SCRAS and its working groups then consider all the suggestions for changes, and produced interim recommendations, (usually discussed at LGRAS). Subsequently, SCRAS and its working groups revise and further develop proposals for changes.

The 2002 review resulted in changes implemented at the start of 2005 (see Appendix B for detail of these. Copies of the list of changes, and the guidance notes (Stats 19, Stats 20 and Stats 21) are available from the Methods and Background section of:

<http://www.transportscotland.gov.uk/analysis/statistics/about/data-sources/road-accidents>

The report of the 2002 review is available from the National Statistics website – go to:

<http://tinyurl.com/8hkl8sf>

The variables and code-lists used from 1999 to 2004 inclusive were shown in Appendix B of *Road Accidents Scotland 2004*. A summary of the changes which took effect from January 2005 appeared in Section 6 of Appendix C of *Road Accidents Scotland 2005*.

Appendix D

Definitions used in road accident statistics, and some other points to note

1. The definition of severity used in the Road Accident statistics

The classification of the severity of an accident (as fatal, serious or slight) is determined by the severity of the injury to the most severely injured casualty. The police usually record this information soon after the accident occurs. However, if further information becomes available which would alter the classification (for example, if a person dies within 30 days of the accident, as a result of the injuries sustained in the accident) the police change the initial classification of the severity.

For the purposes of the Road Accidents statistical returns:

a **fatal injury** is one which causes death less than 30 days after the accident;

a **fatal accident** is an accident in which at least one person is fatally injured;

a **serious injury** is one which does *not* cause death less than 30 days after the accident, *and* which is in one (or more) of the following categories:

(a) an injury for which a person is detained in hospital as an in-patient

or (b) any of the following injuries (whether or not the person is detained in hospital): fractures, concussion, internal injuries, crushings, severe cuts and lacerations, severe general shock requiring treatment

or (c) any injury causing death 30 or more days after the accident;

a **serious accident** is one in which at least one person is seriously injured, but no-one suffers a fatal injury;

a **slight injury** is any injury which is neither fatal nor serious – for example, a sprain, bruise or cut which is not judged to be severe, or slight shock requiring roadside attention;

a **slight accident** is one in which at least one person suffers slight injuries, but no-one is seriously injured, or fatally injured.

Over the years, improvements in vehicle design, and the provision and use of additional safety features, together with changes in the law (eg on the fitting and wearing of seat belts), will all have helped to reduce the severity of the injuries suffered in some accidents. Road safety measures should also have reduced the levels of injuries sustained. For example, if traffic calming schemes reduce average speeds, people may suffer only slight injury in collisions that previously would have taken place at higher speeds and so might previously have resulted in serious injury.

However, it is also possible that some of the changes shown in the statistics of serious injuries and slight injuries may be due to changes in administrative practices, which may have altered the proportion of accidents which is categorised as serious. For example, the distinction between serious and slight injuries could be affected by factors such as changes in hospitals' admission policies. All else being equal, the number of serious injury cases would rise, and the number of slight injury cases would fall, if it became standard procedure for a hospital to keep in overnight, for precautionary reasons, casualties with a particular type of injury. The increase in the number of serious injury accidents in 1994 was partly attributed to a change in the health boards' policies in admitting more child casualties for overnight observation, which in turn changed the classification of many injuries from slight to serious. The number of child casualties recorded as having serious injuries in 1994 was 35% higher than in the previous year. There could also be changes in hospitals' procedures

that would reduce the numbers of serious injury cases. In addition, there is anecdotal evidence that changes in procedures for assigning severity codes may affect the categorisation of injuries. For example, different severity codes might be assigned by a police officer who was at the scene of an accident and by a clerk who bases the code on a police officer's written description of the accident.

2. Other definitions

Accident: The statistical returns include only those accidents which result in personal injury, which occur on roads (including footways), in which a vehicle is concerned, and which become known to the police. The vehicle need not be moving and it need not be in collision. The statistics are therefore of injury road accidents only: damage-only accidents are not included in the figures.

Adults: People aged 16 and over.

Built-up roads: accidents which occur on built-up roads are those which occur on roads which have speed limits of up to 40 miles per hour (*ignoring* temporary speed limits on roads for which the normal speed limit is over 40mph). Therefore, an accident on a motorway in an urban area would *not* be counted as occurring on a built-up road, because the speed limit on the motorway is 70mph. An accident on a stretch of motorway with a temporary speed limit of 30mph would *not* be counted as occurring on a built-up road, because the normal speed limit is 70mph.

Buses and coaches: Include works' buses and (in past years) trams and trolley buses. Vehicles are coded according to their construction, irrespective of their use at the time of the accident. Thus, vehicles of bus construction which are privately licensed are included under 'buses and coaches', while Public Service Vehicle licensed minibuses are included under minibuses.

Cars: Include estate cars and three-wheeled cars.

Casualty: A person killed or injured in an accident. One accident may give rise to several casualties.

Children: People under 16 years old.

Darkness: From half an hour after sunset to half an hour before sunrise, ie 'lighting-up time'.

Drivers: Persons in control of vehicles other than pedal cycles and two-wheeled motor vehicles.

Goods vehicles: Vans, lorries, tankers, milk floats, tractor units travelling without their trailer units.

Heavy goods vehicles: From 1994, heavy goods vehicles have been defined as goods vehicles with a maximum permissible gross vehicle weight of more than 3.5 tonnes. Prior to 1994, they were defined as those with an *unladen* weight of more than 1.5 tons (1.52 tonnes).

Junction: A place at which two or more roads meet, whatever the angle of the axes of the roads (including roundabouts), or within 20 metres of such a place.

Killed: Sustained injuries which caused death less than 30 days after the accident.

Light goods vehicles: From 1994, light goods vehicles have been defined as goods vehicles with a maximum permissible gross vehicle weight of up to 3.5 tonnes. Prior to 1994, they were defined as those with an *unladen* weight of 1.5 tons (1.52 tonnes) or less.

Major roads: Motorways and A roads.

Minor roads: B roads, C roads and unclassified roads.

Motorcycles: Includes all two wheeled motor vehicles.

Motorists: The drivers or riders of motor vehicles (including, for example, motorcyclists).

Motorways: Include A(M) roads.

Non built-up roads: Roads for which the normal speed limit (*ignoring* any temporary speed limits) is more than 40mph.

Other vehicles: Include ambulances, fire engines, pedestrian-controlled vehicles with motors, railway trains or engines, refuse vehicles, road rollers, tractors, excavators, mobile cranes, tower wagons, army tanks, etc – and from 1999, motor caravans. Other non-motor vehicles include those drawn by an animal, ridden horses, invalid carriages without motor, street barrows, etc.

Passengers: Occupants of vehicles, other than the person in control, including pillion passengers.

Pedal cycles: Including toy cycles ridden on the carriageway, tandems and tricycles. Pedal cyclists includes any passengers of pedal cycles.

Pedestrians: Includes people riding toy cycles on the footway, people pushing bicycles, people pushing or pulling other vehicles or operating pedestrian-controlled vehicles, those leading or herding animals, occupants of prams or wheelchairs, and people who alight safely from vehicles and are subsequently injured.

Riders: People in control of pedal cycles or two-wheeled motor vehicles.

Road users: Pedestrians and vehicle riders, drivers and passengers.

Trunk roads: Roads for whose upkeep Scottish Government Ministers are responsible.

Users of a vehicle: All occupants, ie driver (or rider) and passengers, including persons injured while boarding or alighting from the vehicle.

Vehicles involved in accidents: Any vehicle directly involved in an accident where at least one injury is sustained by a pedestrian or vehicle driver, rider or passenger. Vehicles which collide after the initial accident which caused injury are not included, unless they aggravate the degree of injury or lead to further casualties.

3. Some other points to note

Driver and casualty postcodes, and estimated distances between homes and the locations of accidents

Postcodes were added to the Stats 19 returns in 1999. It was accepted that their collection would have to be phased in, as they became readily available from police administrative systems. Indeed, the Stats 20 instructions state if the postcode is not immediately available, leave blank. As a result, blank (or the not known code) is used more often than should be the case in future. There are also codes for non-UK residents and for parked and unattended vehicles.

The straight line (or as the crow flies) distance between the location of the accident and the home of a driver, rider or casualty was estimated using the postcode of the person's home. The grid co-ordinates of the centre of the postcode were obtained from the General Register Office for Scotland's postcode directory file. These were taken as an approximation to the grid co-ordinates of the person's home, and used in conjunction with the grid co-ordinates of the location of the accident (as reported by the police) to estimate the distance. A similar approach was used in the small proportion of cases where there was only the start of a postcode (eg the police might record EH10 if they knew that someone lived in Edinburgh 10, but they could not provide the full postcode) or where only the postal district or postcode sector could be matched with the postcode directory. A distance could not be estimated if the postcode were blank, coded not known or non-UK resident, did not contain a valid postal district, or were for a place outwith Scotland.

Vehicle type: coding of motor caravans

The vehicle type code formerly used for 'Minibus/motor caravan' (code 10) was changed in 1999:

- **Minibus:** the code 10 category now covers only minibuses;
- **Motor caravans** are not identified as a separate category – they are now included with 'Other motor vehicles' (code 14)

As a result, the figures for the categories described in the tables as minibus and other are on different bases for (a) 1998 and earlier years and (b) 1999 and later years. The scale of the discontinuity is not known, because motor caravans have not been identified separately in the statistical returns. However, it is likely that this change has contributed to the fall in the minibus figures between 1998 and 1999, and the rise in the other figures.

Other changes to Stats 19 codes

Changes to the code lists for Stats 19 variables may affect the comparability of the data recorded for the detailed codes. However, they seldom affect the categories for which results are reported in *Reported Road Casualties Scotland*. For example, when the *Scottish Executive (SE)* converted its data for 2004 and earlier years to be on the basis of the new (2005 onwards) code-lists:

- in some cases SE could determine the new code value from the old codes which had been recorded. This was straightforward in cases where only one *new* code corresponded to any particular old code (or combination of old codes). For example, with effect from the start of 2005, the old Road Type codes 3 (dual carriageway – 2 lanes) and 4 (dual carriageway – 3 or more lanes) were replaced by a single new code 3

(dual carriageway) – so the new code value had to be 3 whenever the old code was either 3 or 4.

- in other cases, it was impossible to deduce the new code value from data recorded on the old basis. For example, with effect from the start of 2005, the old Type of Vehicle code 04 (motorcycle over 125 cc) was replaced by *two* new codes (04 – motorcycle over 125 cc and up to 500 cc and 05 – motorcycle over 500 cc). In such a case, SE could *not* derive the correct 2005 code for every over 125 cc motorcycle involved in an accident in 2004 or earlier years, because it did not know their engine capacities. All that SE could do was to allocate whichever of the new codes was the more likely to be correct. DfT's vehicle licensing statistics show many more motorcycles over 500 cc than over 125 cc and up to 500 cc. Therefore, SE allocated a new code 05 (i.e. over 500 cc) whenever the old code was 04. However, **the *Road Accidents Scotland* tables were unaffected because they grouped all types of motorcycle together** (so it did not matter, for the purposes of those tables, which detailed motorcycle code had been allocated). For similar reasons, changes to other variables' code-lists in 1999 or 2005 should not affect the figures published in *Road Accidents Scotland*

4. Estimates of the total volume of road traffic

Some tables include estimates of traffic volumes, or accident or casualty rates calculated from them. The traffic estimates were provided by the Department for Transport (DfT), which produces estimates of the total volume of road traffic for Scotland and for other parts of Great Britain.

These estimates are based on data from a very small cross-section of the roads in Scotland: traffic counts taken at under 800 sites per year plus data from automatic traffic counters at about two dozen sites in Scotland (which are combined with data from similar sites in England and Wales).

DfT's estimates are based on an urban/rural classification of roads, *not* on the built-up/non built-up classification of roads used in the traffic estimates that were made up to 2002 (which is still used for the accident and casualty statistics). In general:

- an *urban* road is a road (other than a Motorway) that lies within the boundaries of an urban area with a population of 10,000 or more in 2001;
- a *built-up* road is one that has a speed limit of 40 m.p.h. or less

As traffic on a particular road can be classed as rural whilst accidents occurring on it classed as built-up, it would be incorrect to estimate an area's accident rate for built-up roads by dividing its number of accidents on built-up roads by its estimated volume of traffic on urban roads. Therefore, estimates of built-up and non built-up accident rates are provided in Table 5 *only* for Scotland *as a whole* – and these estimates may *not* be precise, due to the nature of the classifications.

The DfT traffic estimates provide only a *rough* indication of the likely total volume of traffic in each Council area. These are *not* National Statistics. For example, DfT believes that its estimates of the volume of traffic on minor roads (i.e. B, C and unclassified roads) for Scotland *as a whole* are of acceptable quality. However, the 320 or so counts now taken per year at minor road sites across Scotland represent an average of 10 per local authority per year – clearly too few to be the basis of reliable estimates for individual local authority areas for each year. DfT therefore estimate the total volume of traffic on minor roads in individual local authority areas in other ways (outlined in *Scottish Transport Statistics*). The resulting estimates, which are consistent with the overall totals for Scotland

as a whole, provide only a broad indication of the likely total volume of traffic on minor roads in each local authority area. As a result:

- it is not possible for DfT to quantify the possible margins of error around them;
- they are not classed as National Statistics;
- more detailed breakdowns of the estimates for individual local authority areas (e.g. separately for B, C and unclassified roads; or for urban roads and rural roads) are not published

In addition, DfT's estimates of traffic on major roads in each local authority area are also not classed as National Statistics. They too are based on limited data: as manual traffic counts are taken on a rotating census basis, there may be several years between successive counts at a particular site. Therefore, DfT notes that there could be large errors in its traffic estimates for the major roads in some of the smaller local authority areas. Similar considerations apply to DfT's estimates of the total volume of traffic on all roads in each area, which are produced by adding together its estimates of traffic on major roads and on minor roads.

In conclusion: DfT provides its estimates of the volume of traffic in each local authority area as the best that it can produce from the limited amount of data available to it – rough indications of the likely volume of traffic in each area, for use with caution, as no better estimates are available.

Appendix E

Local Government Reorganisation and the Trunk Road Network

1. Introduction

This Appendix explains how statistics for the areas of the new Councils were produced for the period prior to local government reorganisation on 1 April 1996. It then describes the trunk road network the changes made to it then, and their effect on the statistics. The next section is about identifying accidents which occurred prior to 1 April 1996 on the roads which formed the post- 1 April 1996 trunk road network, so that figures could be produced on a consistent basis pre- and post-1996. Subsequent sections explain how the effect of the change for individual Council areas can be assessed, how the 1994-98 averages for trunk roads and local authority roads were calculated, and how accident and casualty rates for 1995 and earlier years were calculated. The final section mentions how the statistics for some types of road in some areas may be affected by the opening of new roads.

2. Local Government re-organisation

The reorganisation of local government established new Councils with effect from 1st April 1996, to replace the former Regions, Districts and Island Areas. Statistics for the areas covered by the new Councils for earlier years (back to 1981) were derived in three ways:

- a. in the case of the former Island Areas, by allocating all the accidents which occurred in each Island Area to the relevant Council.
- b. in those cases where a whole District fell in a new Council's area, by allocating all the accidents which occurred in that District to the area of the new Council.
- c. in the case of accidents occurring in the five Districts which had major parts falling in several new Councils' areas, by a special exercise, which used the grid co-ordinates recorded for each individual accident to allocate it to the area of one of the new Councils, using a computer mapping system. This was successful for 99% of accidents for these five Districts, consistently over all years from 1981. The remaining 1% of the accidents in the five Districts were assigned to the new Council in which the majority of the District's accidents fell. This should cause only a very small error (considerably less than 1%) for any of the new Councils, in any year.

3. The Trunk Road Network

Trunk roads are those roads for whose upkeep Scottish Ministers are responsible. The Government's view, when it reviewed the trunk road network in 1994, was that the trunk road network should:

- a. provide the road user with a coherent and continuous system of routes which serve destinations of importance to industry, commerce, agriculture and tourism;
- b. define nationally important routes which will be developed in line with strategic national transport demands; and
- c. ensure that those roads which are of predominantly local importance are managed locally.

Currently, the trunk road network in Scotland consists of all the Motorways plus some (but not all) of the A roads. In some cases, the trunk road network may include the whole of a particular road; in other cases, only certain stretches of a road may be part of the trunk road network. For example, only that part of the A7 which runs south of the junction with the

A6091 near Galashiels is part of the current trunk road network: the northern part is *not* a trunk road.

4. Changes to the trunk road network in April 1996, and their effect on the statistics

Following the review of the trunk road network, several changes were made with effect from 1st April 1996 (coinciding with the reorganisation of local government). Some roads (or stretches of road) which had previously been part of the trunk road network were transferred to local authority control: examples include the A7 from near Edinburgh to near Galashiels, and the A91 from the M90 to St Andrews. Some roads which had previously been the responsibility of local authorities became part of the new trunk road network: examples include the A720 Edinburgh City bypass east of the M8 extension and the A95 from Aviemore to Keith. The overall result was that, on 1st April 1996, about 214 miles of road ceased to be trunk road, and about 361 miles of road became trunk road.

Because of these changes to the trunk road network, the original figures for the numbers of accidents which occurred on trunk roads before and after 1st April 1996 were on different bases, and a comparison could be misleading. Comparisons of the figures for local authority roads could also be misleading, particularly when one looked at the figures for the areas covered by certain Councils, because they may relate to significantly different road networks before and after 1 April 1996.

5. Identifying accidents which occurred before April 1996 on the roads which formed the post- 1 April 1996 trunk road network, to enable comparison of the numbers before and after 1996

In order to get figures for some of the years before 1996 which were on the basis of the post- 1 April 1996 road network, a special exercise was undertaken. This identified, from among the accidents which took place between 1st January 1992 and 31st March 1996, those which occurred on the stretches of road which form the new trunk road network (i.e. the trunk road network that took effect from 1st April 1996). As a result, the information that is available in the Transport Statistics branch database enables figures to be produced for the numbers of road accidents on trunk roads, and on local authority roads, using the following definitions of the status of the road:

- a. status *at the time* of the accident - these figures are available for all years
- b. status in terms of the *old* network - available up to 31 March 1996 only
- c. status in terms of the *new* network - available for all years from 1992

It should be noted that the definitions under (b) and (c) above should, strictly speaking, be expanded:

- i. For accidents which occurred *before* 31st March 1996, (b) is actually the status *at the time* of the accident (rather than the status *at 31 March 1996*): the two will differ in the case of any roads whose status changed *before* 31 March 1996. For example, if a road ceased to be a trunk road on (say) 15 May 1994, then definition (b) would show it as a trunk road for accidents before that date, and would show it as a local authority road thereafter.
- ii. For accidents which occurred *after* 1st April 1996, © is actually the status *at the time* of the accident (rather than the status *at 1 April 1996*): the two will differ in the case of any roads whose status changed *after* 1 April 1996. For example, if a road ceased to be a trunk road on (say) 8 July 1996, then definition © would show it as a trunk road for accidents before that date, and would show it as a local authority road thereafter.

6. Assessing the effect of the April 1996 changes on the figures for trunk roads and for local authority roads, for individual local authority areas

Because data for 1992 to 1995 are available both on the basis of the old trunk road network and on the basis of the new trunk road network, one can see the extent of the change in the number of accidents on the trunk road network that was caused by the transfer of roads (or stretches of roads) between the trunk road network and the local authority road network. Similarly, one can compare the figures on the two bases for the local authority road network to see the extent of the change in the total number of accidents on that network that was caused by the transfers.

1992-95 averages on both bases were included in, for example, Tables 4 and 40© of *Road Accidents Scotland 2000*. The figures in the first of these tables showed that the April 1996 changes had little effect on the trunk road network's overall share of the total number of accidents in Scotland as a whole. However, the figures in the second table showed that the changes did have a noticeable effect on the trunk road network's share in some parts of Scotland. For example, the 1992-95 annual average number of casualties, on all types of road, in the area which is now covered by Highland Council was 1,079. Of these, an average of 423 (39%) occurred on the roads which formed the pre- 1 April 1996 trunk road network, and 495 (46%) occurred on the roads which formed the post- 1 April 1996 trunk road network. Therefore, the April 1996 changes could have a noticeable effect on the 1994-98 averages for trunk roads and local authority major roads for some local authority areas.

7. How the statistics for some types of road in some areas may be affected by the opening of new roads

Finally, it should be noted that analysis by type of road does *not* take account of changes in the numbers of accidents which result from *traffic* transferring from one kind of road to another when a new road opens. For example, when a new road is built, the majority of the traffic which uses it may be traffic that previously used another road. In some cases (eg when a motorway is constructed to replace an existing trunk road) the original road which carried the traffic may cease to be a trunk road when the new road opens, because the new road replaces it as a trunk road. However, the records of the accidents which occurred on the original road will continue to show that they occurred on the original road: they will *not* be amended to be counted against the new road. In such a case, when the statistics are analysed on the basis of the new networks, those accidents which occurred on the original road will be counted as occurring on what is now part of the new local authority road network, and those accidents which occurred on the new road will be counted as occurring on the new trunk road network. When one looks at series of figures for the new networks for a number of years, which span the year of the change, the figures for the new local authority network would fall, and the figures for the new trunk road network might rise, in the year in which the new road was opened, because of the transfer of traffic from the original road (which was a trunk road then, but is now part of the local authority road network) to the new road (which is part of the new trunk road network).

APPENDIX F

Frequency of use of values of most STATS 19 variables: 2015

This annex lists most of the "Stats 19" variables, showing the values which were used in the returns for the latest year and the number of times each was used. Variables such as "grid co-ordinates" and "road number" are not listed, because they have many possible values.

Appendix G

The calculation of the likely range of random year-to-year variation in road accident and casualty numbers for Scotland as a whole

1. Introduction

This Appendix describes the methods that were used to calculate the likely range of random year-to-year variation in road accident and casualty numbers for Scotland as a whole that are shown in Figures 2, 3, 4 and 5. Two different methods were used: a simple method for Figures 2, 3 and 5, and a more complex method for Figure 4.

2. Calculating the likely ranges of values for Figures 2, 3 and 5

In the case of Figures 2, 3 and 5, the likely ranges of values were calculated on the assumption that the numbers are the outcome of a Poisson process. This is a process in which events occur at random, with the probability of an event occurring depending upon the underlying rate of their occurrence (*not* upon how long it has been since a previous event, *nor* upon the number of events that have occurred in a recent period). For the purpose of producing these charts, it was assumed that the underlying rate of occurrence in each year is the same as the value of the 5-year moving average centred on that year. (That is why there are no grey dashed lines for the last two years: one cannot calculate a 5-year moving average centred on 2004 until one has the values for 2005 and 2006).

A characteristic of a Poisson distribution is that the mean and the (statistical) variance are the same. Because the numbers are all much larger than 100, the assumption of asymptotic normality applies, and one would expect only about 5% of cases to fall outwith a 95% confidence interval range of plus or minus two standard deviations. Therefore, the upper and lower limits shown on the chart were calculated simply as the moving average plus and minus twice the standard deviation (for smaller numbers, exact ranges could have been calculated using the inverse Chi-square distribution). In the case of Figures 2, 3 and 5, the standard deviation was taken to be the square root of the assumed variance (i.e. the square root of the assumed underlying rate, and therefore the square root of the moving average).

In terms of statistical theory, this approach is appropriate for the number of fatal accidents (shown in Figure 2). However, it is a simplification in the case of the numbers of casualties of various types (shown in Figures 3, 4 and 5), because they have *two* random elements: the occurrence of an accident, and the number of casualties in it. The numbers of casualties would therefore be expected to have a greater range of statistical variability than that resulting from a simple Poisson process. However, as it happens, the simple approach appears to suffice for Figures 3 and 5 (probably because the numbers involved are relatively small, and therefore, as discussed in Section 1.4 of the Commentary, the calculated ranges are quite wide in percentage terms) – but the larger numbers in Figure 4 require a more complex method of calculation of the likely range of values.

3. Calculating the likely range of values for Figure 4

An initial version of Figure 4 was produced using the approach described above – i.e. the numbers of casualties were assumed to be the result of a Poisson process whose underlying rate for each year was the moving average for that year. The standard deviation was simply calculated from the square root of the moving average, and the ranges were simply \pm twice this standard deviation. However, the initial version of the chart showed that this approach under-estimated greatly the variability of the figures, as over half the years (53%) had values which were outwith the calculated ranges.

It was noted earlier that the variation in the number of casualties is likely to be greater than that which would result from a simple Poisson process. A method to deal with this extra-Poisson variation is discussed in a paper by Washington State Department of Health, *Guidelines for using Confidence Intervals for Public Health Assessment* (published in 2002 and available at <http://tinyurl.com/8o9v6bs>). The paper discussed the statistical problem of multiple admissions. For example, an asthma patient may be admitted many times, so that multiple admissions for an individual person are not likely to be independent of each other. A person who is hospitalised once for asthma is more likely to be hospitalised for asthma again than someone who has never been hospitalised for asthma. Therefore, the total count of admissions may not follow a Poisson distribution, and it is typical for the total count in such a situation to exhibit greater variability than would be expected from a Poisson process. As a result, simple methods of estimation (like those used to produce Figures 2, 3 and 5) will produce intervals which are too narrow.

The method proposed in the paper for calculating the variance in such a case is shown below.

For crude or age-specific rates, the rate is given by

$$\hat{R} = d/P \quad (18)$$

where d is the number of hospitalizations and P is the population.

Then the variance of the rate is given by

$$\widehat{\text{var}}(\hat{R}) = \frac{(\sum_{j=1}^P d_j^2) - d^2/P}{P(P-1)} \quad (19)$$

where d_j is the number of hospital admissions for individual j . The summation only needs to be performed over the people in the population who have at least one hospital admission, since $d_j = 0$ for people who are not hospitalized, and they make no contribution to the sum.

There is a clear analogy here with the road casualty figures. In our terms:

- d is the number of killed and seriously injured casualties;
- d_j is the number of killed and seriously injured casualties for accident j ; and
- P is the total number of injury accidents (including slight accidents)

We want to calculate the variance of d .

Because $R = d / P$ it follows that $d = R * P$
and the variance of d can be calculated from the variance of R .

The calculation of the variance of R requires one to sum the squares of the d_j s – i.e. the squares of the numbers of people who were killed or seriously injured in each injury accident. These numbers were extracted from the Transport Scotland's computer database, which holds details of individual injury accidents back to 1979. For example, in 1979 there were 23,064 injury accidents. 14,800 of these had only slight casualties, 7,077 had one KSI casualty, 843 had two KSI casualties, 195 had three KSI casualties, and so on. The sum of the squares of the d_j s is then simply $(7,077 * 1^2) + (843 * 2^2) + (195 * 3^2) +$ and so on. The variance of R can therefore be calculated for each year for 1979 onwards. Because figures for the numbers of casualties in each injury accident are not available for earlier years, it is not possible to calculate variances on this basis for years before 1979.

There is an added complication in our case as the total number of injury accidents (our P), which was assumed to be the result of a Poisson process, is *also* subject to random year-to-year variation, and therefore also has a variance associated with it. The standard deviation here can be calculated in the simple way, just the square root of the moving average value.

Then, because $d = R * P$, the variance of d is calculated as the variance of R plus the variance of P . (There is no covariance between the d_j and the P_j , because the value of P_j is equal to one for every value of d_j , since each P_j is a single injury accident). The likely ranges of values are then calculated in the usual way, with the interval being +/- twice the standard deviation.

Figure 4 was prepared on this basis. This method appears to produce more realistic measures of the variability of the number of KSI casualties, but there are many years' figures (around a third) outwith the calculated ranges. The likely reason for this is that *statistical variability is not the only reason for year-to-year changes* – other factors have contributed to sharp falls and rises in KSI casualty numbers, as discussed in Section 1.4 of the Commentary. As the Commentary mentioned, in effect, *such factors change the Poisson process's underlying rate of occurrence of accidents and/or casualties*, and therefore, in effect, introduce a break into the series of moving average values. The method used to calculate the likely range of random year-to-year variation cannot take account of the effect of such changes.

Appendix H

Illustrating the likely ranges of random year-to-year variation in casualty rates for local authority roads for each local authority area

The following table and the accompanying charts were first published as Table 41 (b) in *Road Accidents Scotland 2005* in November 2006 and have now been updated using data for 2010 to 2014. They were initially prepared following a discussion, at a meeting of Liaison Group on Road Accident Statistics in June 2006, of the possible inclusion in *Road Accidents Scotland* of charts which compare road accident or casualty rates by local authority area, using a method which was described in a paper by Paul Hewson (Exeter University) in the June 2004 edition of *Traffic Engineering and Control*. This involves the production of so-called caterpillar plots. These are charts which show:

- the values in the latest year (or period) for each area, in order from lowest to highest (though in this case Local Authorities are grouped within police force area for ease of comparison); and
- the likely range of random statistical variation around each value (these indicate the likely maximum range of year-to-year variation in the figures due to the random nature of accidents – based on statistical theory, one would expect only 5% of values to be outwith this range)

Such charts allow one to see (for example) the kinds of areas which have the lowest rates, and whether certain areas' figures differ significantly (e.g. one can be sure that the values for two areas *do* differ significantly if there is *no* overlap between their likely ranges of random variation). Members of the Group felt that it would be useful to include such charts, but with some changes – for example, the local authorities should appear in the standard *Road Accidents Scotland* order, and the values should be provided in a table, for the benefit of those who wished to use the numbers.

The likely ranges of random year-to-year variation were calculated by assuming that the numbers of casualties are the outcome of a Poisson process (as in the Hewson paper). However, the method of calculation was simpler than that used by Hewson. The main features of the approach, which was applied using the numbers for each of the three types of casualty for each local authority area, are described below.

First, it was assumed that the annual average for a five year period provides the best estimate of the underlying rate of occurrence of casualties for the single year in the middle of that period. For example, it was assumed that the annual average for 2010 to 2014 provides the best estimate of the underlying rate of occurrence of casualties around 2012. This figure was then taken as representing the number of casualties that one would expect to arise in 2012, on the basis that these numbers are the outcome of a Poisson process.

A characteristic of a Poisson distribution is that the values of the mean and the (statistical) variance are the same. The annual average number of casualties for 2010 to 2014 was therefore used as the estimate of the variance of the number of casualties, and its square root was used as the estimate of the standard deviation of the number of casualties.

The likely range of random year-to-year variation around the expected number of casualties for 2012 was then estimated using the underlying rate for 2012 (the annual average for 2010 to 2014) and the estimated standard deviation. The ranges were calculated in a similar way to 95% confidence intervals – i.e.:

- if the relevant casualty count was less than 100, the ranges (like exact confidence intervals) were calculated using the inverse Chi-squared distribution, as a result of which:
 - the ranges are not symmetric about the expected number of casualties;
 - in cases where the numbers are small, it is not possible for the lower limit of the range to have a value of less than zero
- if the relevant casualty count was 100 or more, the Normal approximation was used – i.e. the range was based on the expected number of casualties plus or minus twice the estimated standard deviation

The estimated upper and lower limits to the likely ranges of casualty numbers were then divided by the traffic estimates (in 100s of million vehicle kilometres) to get the likely ranges of values of casualty rates (per 100 million vehicle-kilometres). As the traffic estimates tend to change only slightly from year to year, it was assumed, for simplicity, that they are not affected by any random variation (so there was no need to widen the confidence limits accordingly).

Two points should be noted:

- the calculation of the limits used the expected number of casualties (rather than the actual number of casualties) in 2012 in order to show how the actual casualty rate that arose in that year compares with the likely range of values for that year. This makes it easy to see which (if any) local authority areas had, by chance, casualty rates in 2012 that were particularly high (compared with the rates that would have been expected on the basis of the casualty numbers for the five year period centred on that year), and which areas had, by chance, particularly low casualty rates in 2012;
- the figures cover only local authority roads, in order that any comparison of the figures for different local authorities is not affected by the casualty rates of any trunk roads in those areas. Transport Scotland is responsible for the trunk road network – not local authorities. In general, Motorways and trunk A roads have lower accident rates than other types of road (as can be seen from Table 5[c]), so areas which have a higher proportion of traffic on (say) Motorways may tend to have lower casualty rates. Therefore, any comparison of the casualty rates for a number of local authority areas (such as the four large cities) will be more meaningful if the figures relate only to local authority roads and therefore are unaffected by any differences in the proportions of traffic on (say) Motorways in those areas.

The table presents the estimated limits of the likely ranges of values in 2012 for each of the three casualty rates for each local authority area. It also shows the corresponding actual casualty rate for 2012. The four charts show the numbers graphically. It will be seen that most of the actual rates fall within the likely ranges of values – but the following numbers of cases do not:

- child killed and seriously injured casualty rate - one case;
- (all ages) fatal casualty rate - seven cases;
- (all ages) seriously injured casualty rate - two cases;
- slight casualty rate - four cases

Such out of range numbers are *not* a cause of concern, given that one would expect about 5% of cases to be outwith the estimated ranges (with 32 local authorities, one would expect

a couple of cases outwith the likely ranges for each of the three casualty rates). While seven out of range cases of the fatal casualty rate is more than one would expect, it is *not* so many as to suggest that something is wrong with the method of calculating the ranges. Most of the out of range cases are only *slightly* outwith the likely ranges; and there is *no* suggestion of any clear bias in the figures, because some of them are above the upper limit and others are below the lower limit. In any case, one might expect that there would be more cases of out of range values for the slight casualty rate, because the numbers of casualties from which it is calculated are much higher than the numbers from which the other two rates are calculated. As mentioned in Appendix G) the larger the number, the smaller that the level of likely random variation is as a percentage of the value, and therefore the more likely it is that external factors (e.g. the results of various road safety measures) will have an effect which is greater than that which would be expected due to random year-to-year variation alone – and, therefore, the more likely it is that there will be out-of-range values.

average**

Appendix I

Scottish Parliamentary Questions: September 2014 to August 2015

This Appendix lists the most recent Scottish Parliamentary Questions on road accident and casualty statistics for which answers were drafted by the Transport Statistics branch. It does *not* provide a complete list of all Parliamentary Questions relating to road accidents, because it excludes (for example) questions which were:

- about accidents and casualties on trunk roads in Scotland – answers to which were drafted by Transport Scotland's Trunk Roads and Bus Operations section as it is responsible for the trunk road network;
- about matters such as safety cameras, accidents involving school buses, or the number of people involved in road accidents who were convicted of certain offences – answers to which were drafted by the parts of the Scottish Government with responsibility for the relevant policy areas (Transport Statistics contributed to some of these answers – e.g. by providing whatever relevant statistics it held, or by explaining why the information requested was not available from the Stats 19 returns);
- asked at the Westminster Parliament – answers to which were drafted by the Department for Transport, whose GB-wide database includes a copy of the Scottish Stats 19 data

However, although its coverage is not comprehensive, this Appendix should be of interest to some users of *Reported Road Casualties Scotland* because it provides examples of the kinds of uses that are made of the Stats 19 data.

Almost all the answers can be found in previous editions of Reported Road casualties Scotland <http://bit.ly/TSSStats-RRCS> or via <http://tinyurl.com/9b9ef8j>

Question:	Answer (*)	Reference
September 2014 to August 2015		
... how many road collisions took place in each local authority area in the last 12 months involving a (a) motor vehicle and a cyclist and (b) cyclist and a pedestrian.	Information provided(#)	S4W-24714
... in road collisions involving (a) vehicles and pedestrians and (b) cyclists and pedestrians in the last 12 months, in what percentage of cases the (i) driver, (ii) cyclist and (iii) pedestrian was at fault, broken down by local authority area.	Information provided(#)	S4W-24715

(*) – the entries in this column are as follows:

information provided – this category includes cases where:

- only some of the information that was requested was available – e.g. questions about:
 - the numbers of road accidents and hit-and-run incidents – because the Stats 19 returns cover only *injury* accidents which were *reported to the Police*, so do *not* cover *all* accidents/incidents; or
 - the causes of accidents since 1999 – because Contributory Factors were only added to Stats 19 at the start of 2005.
- the only information that could be provided was on a different basis from that which was requested

information not available – this category includes cases where the information requested:

- does not exist; or
- is not held centrally; or
- cannot be obtained from the Transport Statistics road accident statistics system without disproportionate cost, because the system is not designed to provide it

(\$) – the answer referred to a publicly-available source (e.g. *Reported Road Casualties Scotland*, or another question which had been answered previously) which contained some or all of the information

which was requested. The answer may also have provided some information that was not available from the publicly-available source.

(#) – the answer explained that the statistics which were provided were based upon the data which are held in the central road accident statistics database and which were collected by the police at the time of the accident and subsequently reported in the Stats 19 returns. They may differ from any figures which the local authorities would provide now, because they do not take account of any subsequent changes or corrections that local authorities may have made to the statistical information, for use at local level, about the location of each accident, based upon their knowledge of the roads and areas concerned.

Index

Index of tables (Statistical Tables section)

NB: there are no entries in this index for some topics which appear in many tables, such as severity and built up/non-built up

Sub-themes	Main-theme	Years	Table
Accidents	Historic Series	1966 to 2015	1
Accidents by severity	Historic Series	1970 to 2015	2
Accidents by severity and road class	Accidents	2004-08 and 2011-2015 ave, 2005-2015	5a
Accidents involving illegal alcohol levels	Drink Drive	2004-08 & 2010-14, 2004 to 2014	22
Accident rates by police force area (traffic-based)	Accidents	2004-08 and 2011-2015 ave	5c
Accident rates by road class (traffic-based)	Accidents	2004-08 and 2011-2015 ave, 2005-2015	5b
Adult casualties by age and mode of transport	Casualties	2004-08 ave, 2015	24
Adult casualties by day of week and mode of transport	Casualties	2011-2015 ave	30
Adult casualties by main modes of transport	Casualties	2004-08 & 2011-2015 ave, 2011 to 2015	25
Adult casualties by month	Casualties	2011-2015 ave	29
Adult casualties by time of day and weekdays/weekend	Casualties	2011-2015 ave	28
Adult pedestrian crossing details	Casualties	2004-08 & 2011-15 ave, 2011 to 2015	35
Age and sex of drivers	Car drivers	2004-08 & 2011-15 ave, 2005 to 2015	18
Age groups (broad)	Casualties	2004-08 ave, 2015	24
Age groups (detailed)	Casualties	2004-08 & 2011-15, 2011 to 2015	31
Age groups (detailed) by mode – numbers, rates	Casualties	2011-15 ave	32
Age groups by sex and casualty class – numbers, rates	Casualties	2011-2015 ave	34
Age of driver and manoeuvre	Car drivers	2011-2015 ave	17
Breath tests and results by day and time	Drivers breath	2011-2015 ave	20
Breath tests and results by police force	Drivers breath	2004-08 & 2011-15, 2011 to 2015	19
Breath tests and results by time of day	Drivers breath	2004-08 & 2011-15, 2011 to 2015	21
Casualties	Historic Series	1953 to 2015	1
Casualties by severity	Historic Series	1938 to 2015	2
Casualties in accidents which involved illegal alcohol levels	Drink-drive	2004-08 & 2010-14, 2004 to 2014	22
Casualties Killed & Serious Inj. By council and road type	Casualties	2004-08 & 2011-2015 ave, 2005-2015	40
Casualties KSI, Slight & slight casualty rate by police force	Casualties	2004-08 & 2011-2015 ave, 2006 to 2015	42
Casualties Slight & slight casualty rate by council	Casualties	2004-08 & 2011-2015 ave, 2006 to 2015	41
Casualty class	Casualties	Casualties 2004-08 & 2011-2015 ave, 2011 to 2015	26
Casualty class by age group	Casualties	2011-2015 ave	34
Casualty rates by age group	Casualties	2004-08 & 2011-2015 ave, 2011 to 2015	31
Casualty rates on local authority roads by council	Casualties	2013, and likely range of values	Appendix H
Child casualties by day of week and mode of transport	Casualties	2011-2015 ave	30
Child casualties by main modes of transport	Casualties	2004-08 & 2011-2015 ave, 2011 to 2015	25
Child casualties by mode of transport	Casualties	2004-08 ave, 2015	24
Child casualties by month	Casualties	2011-2015 ave	29
Child casualties by time of day and weekdays/weekend	Casualties	2011-2015 ave	27
Child Killed & Serious casualties by council and road type	Casualties	2004-08 & 2011-2015 ave, 2005-2015	40
Child Killed & Seriously Injured by police force area	Casualties	2004-08 & 2011-2015 ave, 2006 to 2015	42
Child pedestrian crossing details	Casualties	2004-08 & 2011-2015 ave, 2011 to 2015	35
Cost per accident by element of cost	Accident costs	2015	9b
Cost per accident by road type	Accident costs	2015	10
Cost per casualty by severity (GB)	Accident costs	2015	9a
Costs by road type – Scotland totals	Accident costs	2005 to 2015	11
Council by severity	Casualties	2004-08 & 2011-2015 ave, 2015	37
Council of residence vs council of accident location	Casualties	2015	39b
Council by severity and road type	Casualties	2004-08 & 2011-2015 ave, 2011 to 2015	36
Day of week by child/adult and mode of transport	Casualties	2011-2015 ave	30

Distance between home of driver/rider and accident	Drivers and riders	2015	16
Distance between home of casualty and accident	Casualties	2015	39a

Pedestrian/non-pedestrian casualties by age and severity	1996 edition pages 92,93
Accidents by junction detail and severity	2000 edition pages 60, 61
Care drivers involved in accidents by age of driver and type of accident	2000 edition pages 76, 77
Vehicles involved by type	2000 edition pages 66, 67
School: pupils on journey to/from, by severity	2013 edition page 208
School: pupils on journey to/from, by mode	2013 edition page 208

ERRORS IN THE PREVIOUS EDITION

This list covers errors which occurred in the preparation of the tables or the commentary in *Reported Road Casualties Scotland*.

We apologise for the following errors, which we have found in the previous edition.

Table 23a, page 115 numbers for the years 2009 to 2014 were mistakenly used to calculate the 2010 to 2014 averages for each mode of transport.

Tables O, 12, 13, 14a/b and 16 A new 'unknown cc' motor cycle category was included from 2013 onwards. Previously these vehicles were mistakenly included in the 'other' category. They are now included with motorcycles.

Any problems or inconveniences resulting from these errors are regretted.

Transport Statistics publications produced by other administrations

The **Department for Transport** (DfT) produces many statistical publications, most of which provide detailed breakdowns of the figures for GB/UK as a whole. However, some contain statistics for Scotland.

DfT's annual **Regional Transport Statistics** bulletin gives figures on many topics for Scotland, Wales, Northern Ireland and each of the regions of England. It should be the "first port of call" for anyone who wishes to compare any figures for transport in Scotland with those for some or all of the other parts of GB/UK.

Other DfT publications include some figures for Scotland, such as *Transport Statistics Great Britain* (which, like *Scottish Transport Statistics*, contains figures on many different aspects of Transport), *Maritime Statistics*, *Public Transport Statistics*, and *Road Casualties Great Britain*. Further information about DfT Transport Statistics publications is available via: <http://tinyurl.com/nm8re6m>

The **Welsh Assembly Government** produces various publications which contain statistics on transport in Wales, in particular *Welsh Transport Statistics*. More information is available via: <http://new.wales.gov.uk>

The statistical publications produced in **Northern Ireland** include *Northern Ireland Transport Statistics*. More information is available via: www.drdni.gov.uk/index/statistics.htm

TRANSPORT STATISTICS USERS' GROUP

The Transport Statistics Users' Group (TSUG) was set up in 1985 as a result of an initiative by the Statistics Users Council and the The Institute of Logistics and Transport (then known as The Chartered Institute of Transport).

From its inception TSUG has had strong links with the government departments responsible for transport statistics. It has developed an excellent working relationship with the Transport Analytical Services Team of Transport Scotland.

The aims of TSUG are:

- to identify problems in the provision and understanding of transport statistics, and to discuss solutions with the responsible authorities;
- to provide a forum for the exchange of views and information between users and providers;
- to encourage the proper use of statistics through greater publicity.
- to facilitate a network for sharing ideas, information and expertise.

The main activities of TSUG are:

- The production of a regular Newsletter containing news and reviews of matters relating to transport statistics and the TSUG membership.
- The organisation of Seminars addressing contemporary issues in the field of transport statistics. Most seminars are held in London, but there is an annual seminar in Edinburgh and other ad hoc regional seminars. Reports of seminars appear in the Newsletter.
- The maintenance of a Website which TSUG Members can use to find out about and book on TSUG seminars, and access an information archive.

The membership of TSUG includes government agencies, local authorities, trade associations, transport consultants, transport operators and universities, as well as individual professionals. Corporate membership of the Group is £50, personal membership £22.50, and student membership £10. For further information about TSUG and membership, please visit the website at www.tsug.org.uk or contact:

TSUG Membership Secretary

A NATIONAL STATISTICS PUBLICATION FOR SCOTLAND

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act 2007 and signifying compliance with the Code of Practice for Official Statistics.

Designation can be interpreted to mean that the statistics: meet identified user needs; are produced, managed and disseminated to high standards; and are explained well.

Correspondence and enquiries

For enquiries about this publication please contact:

Andrew Knight,
Transport Scotland Analytical Services,
Telephone: 0131 244 7256,
e-mail: transtat@transport.gov.scot

For general enquiries about Scottish Government statistics please contact:

Office of the Chief Statistician, Telephone: 0131 244 0442,
e-mail: statistics.enquiries@scotland.gsi.gov.uk

How to access background or source data

The data collected for this statistical bulletin:

- ☒ are available in more detail through Scottish Neighbourhood Statistics
- ☒ are available as part of a GB dataset on data.gov.uk
- ☒ may be made available on request, subject to consideration of legal and ethical factors. Please contact Transtat@transport.gov.scot for further information.
- ☐ cannot be made available by Scottish Government for further analysis as Scottish Government is not the data controller.

Complaints and suggestions

If you are not satisfied with our service or have any comments or suggestions, please write to the Chief Statistician, 3WR, St Andrews House, Edinburgh, EH1 3DG, Telephone: (0131) 244 0302, e-mail statistics.enquiries@scotland.gsi.gov.uk.

If you would like to be consulted about statistical collections or receive notification of publications, please register your interest at www.scotland.gov.uk/scotstat

Details of forthcoming publications can be found at www.scotland.gov.uk/statistics
