1 Operational Road Traffic Noise Results

1.1 Detailed Road Traffic Noise Calculations

1.1.1 The tables below present the road traffic noise modelling results for Project 9 (Crubenmore to Kincaig). For those receptors identified to comprise of a single storey (e.g. bungalow), modelling results at 1.5m above ground are presented. For those receptors identified to comprise of two storeys (e.g. house), noise modelling results at 4m above ground are presented.

1.1.2 Where a building is predicted to experience different changes in noise level on different façades, the least beneficial change in the level of road traffic noise is reported in the assessment tables. For example, where all façades show a decrease in road traffic noise, then the smallest decrease is reported. Or where all façades show an increase in road traffic noise level, then the largest increase is reported.

1.1.3 The least beneficial change for each receptor is reported in **Table 1-1** and **Table 1-2**. It should be noted, that even where the same façade is being used for the various comparisons, this could still lead to a different Do-Minimum noise level being quoted in **Table 1-1** and **Table 1-2**. The noise modelling package calculates the noise level at several points on any one façade, which can lead to a different calculation point, and hence different noise level, being used for each comparison.

1.1.4 The following table presents the calculated road traffic noise levels for designated sites and public rights of way. For most receptors several locations were calculated, and the worst-case change in noise is included within the assessment tables in the Chapter 17.
